Antipsychotics: increased risk of ventricular arrhythmias when amiodarone given with antipsychotics that prolong the QT interval with antipsychotics that prolong the QT interval; increased risk of ventricular arrhythmias when amiodarone given with antipsychotics that prolong the QT interval; increased risk of ventricular arrhythmias when amiodarone given with antipsychotics that prolong the QT interval

Amiodarone (continued)  
· Amiodarone: increased risk of ventricular arrhythmias when amiodarone given with cimetidine

Antidepressants: increased risk of ventricular arrhythmias when amiodarone given with antidepressants that concomitantly increase plasma concentration of amiodarone

Anticoagulants: amiodarone inhibits metabolism of warfarin and warfarin antagonists: increased risk of bleeding when amiodarone given with warfarin and warfarin antagonists

Antihistamines: increased risk of bleeding when amiodarone given with antihistamines

Antileukotrienes: increased risk of bleeding when amiodarone given with antileukotrienes

Calcium-channel Blockers: increased risk of bleeding when amiodarone given with calcium-channel blockers

Beta-blockers: increased risk of bleeding when amiodarone given with beta-blockers

Loop diuretics: increased risk of bleeding when amiodarone given with loop diuretics

Thyroid Hormones: increased risk of bleeding when amiodarone given with thyroid hormones

Orlistat: increased risk of bleeding when amiodarone given with orlistat

Amisulpride see Antipsychotics

Amitriptyline see Antidepressants, Tricyclic

Amlodipine see Calcium-channel Blockers

Amobarbital see Barbirurates

Amodarone (continued)  
· Amiodarone: increased risk of ventricular arrhythmias when amiodarone given with boloterodine
Amphotericin
Note Close monitoring required with concomitant administration of nephrotoxic drugs or cytotoxics
Antibacterials: increased risk of nephrotoxicity when amphotericin given with aminoglycosides or polymyxins; possible increased risk of nephrotoxicity when amphotericin given with vancomycin
Antifungals: amphotericin reduces renal excretion and increases cellular uptake of flucytosine (toxicity possibly increased); effects of amphotericin possibly antagonised by imidazoles and triazoles; plasma concentration of amphotericin possibly increased by fluconazol
Cardiac Glycosides: hypokalaemia caused by amphotericin increases cardiac toxicity with cardiac glycosides
Ciclosporin: increased risk of nephrotoxicity when amphotericin given with ciclosporin
Corticosteroids: increased risk of hypokalaemia when amphotericin given with corticosteroids; needed to control reactions
Cytotoxics: increased risk of ventilatory arrhythmias when amphotericin given with ciclosporin—avoid concomitant use unless corticosteroids needed to control reactions
Diuretics: increased risk of hypokalaemia when amphotericin given with loop diuretics or thiazides and related diuretics
Vasodilator Antihypertensives: effects of thiopental possibly enhanced by clonidine
Analgesics, General (intravenous) see Anaesthetics, General (intravenous)

Anamphetamines: enhanced hypotensive effect when general anaesthetics given with methyldopa
Antidepressants: increased risk of arrhythmias when volatile liquid general anaesthetics given with methyldopa
Dopaminergics: increased risk of arrhythmias when volatile liquid general anaesthetics given with levodopa
Diuretics: increased hypotensive effect when general anaesthetics given with diuretics
Vasodilator Antihypertensives: increased hypotensive effect when general anaesthetics given with methyldopa

Anesthesia, General (continued)
Cytotoxics: nitrous oxide increases antifolate effect of etoposide; methotrexate—avoid concomitant use
Methotrexate: increased hypotensive effect when general anaesthetics given with methotrexate
Diuretics: enhanced hypotensive effect when general anaesthetics given with diuretics
Dopaminergics: increased risk of arrhythmias when volatile liquid general anaesthetics given with levodopa
Diuretics: increased hypotensive effect when general anaesthetics given with diuretics

Anesthesia, General (vaporized) see Anaesthesia, General

Anesthetics, General
Note See also Surgery and Long-term Medication, p. 775
ACE Inhibitors: enhanced hypotensive effect when general anaesthetics given with ACE inhibitors
Adrenergic Neurone Blockers: enhanced hypotensive effect when general anaesthetics given with adrenergic neurone blockers
Alpha-blockers: enhanced hypotensive effect when general anaesthetics given with alpha-blockers
Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when general anaesthetics given with angiotensin-II receptor antagonists
Antibacterials: metabolism of etomidate inhibited by fentanyl (consider reducing dose of etomidate); effects of thialpine possibly enhanced by aspirin; effects of intravenous general anaesthetics and volatile liquid general anaesthetics possibly enhanced by opioid analgesics
Beta-blockers: enhanced hypotensive effect when general anaesthetics given with beta-blockers
Blot-solvents: increased risk of arrhythmias and hypotension when general anaesthetics given with tricyclics
Antipsychotics: enhanced hypotensive effect when general anaesthetics given with antipsychotics; effects of thialpine enhanced by droperidol
Anxiolytics and Hypnotics: increased sedative effect when general anaesthetics given with anxiolytics and hypnotics

Analgésics see Analgesics
Cytotoxics:

Angiotensin-II Receptor Antagonists

ACE Inhibitors: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with adrenergic neurone blockers

Alcohol: enhanced hypotensive effect when angiotensin-II receptor antagonists given with alcohol

Aldesleukin: enhanced hypotensive effect when angiotensin-II receptor antagonists given with aldesleukin

Alikiren: rbesanat possibly reduces plasma concentration of aikoiren

Alpha-blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with alpha-blockers

Analgesics, General: enhanced hypotensive effect when angiotensin-II receptor antagonists given with general anaesthetics

Analgesics: increased risk of renal impairment when angiotensin-II receptor antagonists given with NSAIDs, also hypotensive effect antagonised

Antibacterials: plasma concentration of losaratan and its active metabolite reduced by rifampin; possible increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with trimethoprim

Anticoagulants: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with heparins

Antidepressants: hypotensive effect of angiotensin-II receptor antagonists possibly enhanced by MAOIs

Antipsyucotics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with anti-psychotics

Anxiolytics and Hypnotics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with anxiolytics and hypnotics

Beta-blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with beta-blockers

Calcium-channel Blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with calcium-channel blockers

Ciclosporin: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with ciclosporin

Clonidine: enhanced hypotensive effect when angiotensin-II receptor antagonists given with clonidine

Corticosteroids: hypotensive effect of angiotensin-II receptor antagonists antagonised by corticosteroids

Diazoxide: enhanced hypotensive effect when angiotensin-II receptor antagonists given with diazoxide

Diuretics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with diuretics; increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with potassium-sparing diuretics and aldosterone antagonists

Dopaminergics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with levo-dopa

Lithium: angiotensin-II receptor antagonists reduce excretion of lithium (increased plasma concentration)

Methyldopa: enhanced hypotensive effect when angiotensin-II receptor antagonists given with methyldopa

Moxisylyte: enhanced hypotensive effect when angiotensin-II receptor antagonists given with moxisylyte

Moxonidine: enhanced hypotensive effect when angiotensin-II receptor antagonists given with moxonidine

Muscle Relaxants: enhanced hypotensive effect when angiotensin-II receptor antagonists given with baclofen or tizanidine

Nitrates: enhanced hypotensive effect when angiotensin-II receptor antagonists given with nitrates

Note: Antacids should preferably not be taken at the same time as other drugs since they may impair absorption

ACE Inhibitors: antacids possibly reduce absorption of ACE inhibitors; antacids reduce absorption of captopril, enalapril and fosinopril

Analgesics: alkaline urine due to some antacids increases excretion of aspirin

Antibacterials: antacids reduce absorption of azithromycin, cefaclor, cefpodoxime, ciprofloxacin, ivermectin, levofloxacin, moxifloxacin, norfloxacin, ofloxacin, rifampin and tetracyclines; avoid concomitant use of antacids with methenamine; oral magnesium salts (as magnesium trisilicate) reduce absorption of nitrofurantoin

Antiepileptics: antacids reduce absorption of gabapentin and phenytoin

Antifungals: antacids reduce absorption of itraconazole and ketoconazole

Antihistamines: antacids reduce absorption of fexofenadine

Antimalarials: antacids reduce absorption of chloroquine and hydroxychloroquine; oral magnesium salts (as magnesium trisilicate) reduce absorption of proguanil

Antipsyucotics: antacids reduce absorption of phenothiazines and sulphide

Antirheumatics: antacids possibly reduce plasma concentration of azastavir; antacids reduce absorption of tipranavir

Bile Acids: antacids possibly reduce absorption of bile acids

Bisphosphonates: antacids reduce absorption of bisphosphonates

Cardiac Glycosides: antacids possibly reduce absorption of digoxin

Corticosteroids: antacids reduce absorption of defla-siurosart

Cytotoxicss: antacids possibly reduce plasma concentration of erlotinib—give antacids at least 4 hours before or 2 hours after erlotinib

Deferasirox: antacids containing aluminium possibly reduce absorption of deferasirox (manufacturer of deferasirox advises avoid concomitant use)

Dipyridamole: antacids possibly reduce absorption of dipyridamole

Erbetropovap: antacids reduce absorption of eltrobro-pap (give at least 4 hours apart)

Iron: oral magnesium salts (as magnesium trisilicate) reduce absorption of oral iron

Lipid-regulating Drugs: antacids reduce absorption of rosuvastatin

Lithium: sodium bicarbonate increases excretion of lithium (reduced plasma concentration)

Mycophenolate: antacids reduce absorption of mycophenolate

Penicillamine: antacids reduce absorption of penicillamine

Polystyrene Sulphonate Resins: risk of intestinal obstruction when aluminium hydroxide given with polystyrene sulphonate resins; risk of metabolic

Appendix 1: Interactions 807

Appendix 1: Interactions

Angiotensin-II Receptor Antagonists (continued)

Oestrogens: hypotensive effect of angiotensin-II receptor antagonists antagonised by oestrogens

Potassium Salts: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with potassium salts

Prostaglandins: enhanced hypotensive effect when angiotensin-II receptor antagonists given with aspirin

Tacroplmus: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with tacrolimus

Vasodilator Antihypertensives: enhanced hypotensive effect when angiotensin-II receptor antagonists given with hydralazine, minoxidil or sodium nitroprusside
Antacids
Polyvalent Sulphonate Resins (continued)
-alcoholism when oral magnesium salts given with polysulphonate resins
Thyroid Hormones: antacids possibly reduce absorption of levothyroxine
Ulcer-healing Drugs: antacids possibly reduce absorption of lansoprazole
● Ulipristal: avoidance of antacids advised by manufacturer of ulipristal (plasma concentration of ulipristal possibly reduced)
Antazoline see Antihistamines
Anti-arrhythmics see Adenosine, Amiodarone, Disopyramide, Dronedarone, Flecainide, Lidocaine, and Propafenone
Antibacterials see individual drugs
Anticoagulants see Coumarins, Dabigatran etexilate, Heparins, Phenindione, and Rivaroxaban
Antidepressants see Agomelatine; Antidepressants, SSRI; Antidepressants, Tricyclic; Antidepressants, Venlafaxine
Antidepressants, Noradrenaline Re-uptake Inhibitors see Reboxetine
Antidepressants, SSRI
Alcohol: sedative effects possibly increased when SSRIs given with alcohol
Anaesthetics, Local: fluvoxamine inhibits metabolism of ropivacaine—avoid prolonged administration of ropivacaine
● Analgesics: increased risk of bleeding when SSRIs given with NSAIDs or aspirin; fluoxetine, fluvoxamine, paroxetine and sertraline possibly increase plasma concentration of methadone; increased risk of CNS toxicity when SSRIs given with tramadol
Anti-arrhythmics: fluoxetine increases plasma concentration of flecainide; paroxetine possibly inhibits metabolism of propafenone (increased risk of toxicity)
● Anticoagulants: SSRIs possibly enhance anticoagulant effect of coumarins
● Antidepressants: avoidance of fluoxetine advised by manufacturer of venlafaxine; possible increased serotoninergic effects when SSRIs given with duloxetine; fluoxetine inhibits metabolism of duloxetine; fluvoxamine increases plasma concentration of duloxetine; paroxetine possibly increases plasma concentration of duloxetine; paroxetine inhibits metabolism of duloxetine; fluvoxamine possibly inhibits metabolism of duloxetine
Antidepressants, Tricyclic; Antidepressants, Venlafaxine
Antihistamines: antiparkinsonian effect of SSRIs possibly increased by cyproheptadine
Antipsychotics: avoidance of fluoxetine, fluvoxamine or sertraline advised by manufacturer of droperidol (risk of ventricular arrhythmias); fluoxetine increases plasma concentration of clozapine, haloperidol and risperidone; fluvoxamine possibly increases plasma concentration of haloperidol; paroxetine inhibits metabolism of perphenazine (reduce dose of perphenazine); fluoxetine and paroxetine possibly inhibit metabolism of aripiprazole (reduce dose of aripiprazole); citalopram possibly increases plasma concentration of clozapine (increased risk of toxicity); fluvoxamine, paroxetine and sertraline increase plasma concentration of clozapine; fluvoxamine increases plasma concentration of olanzapine; SSRIs possibly increase plasma concentration of olanzapine
● Antivirals: plasma concentration of paroxetine and sertraline possibly reduced by darunavir; plasma concentration of paroxetine possibly reduced by ritonavir; plasma concentration of SSRIs possibly increased by ritonavir
● Anxiolytics and Hypnotics: fluoxetine increases plasma concentration of alprazolam; fluvoxamine increases plasma concentration of some benzodiazepines; fluvoxamine increases plasma concentration of temazepam; fluvoxamine and paroxetine possibly increase plasma concentration of olanzapine; SSRIs possibly increase plasma concentration of olanzapine
● Antiparkinsonians: avoid concomitant use; fluoxetine and paroxetine increase plasma concentration of dopamine; fluoxetine possibly increases plasma concentration of dopamine

Antidepressants, SSRI (continued)
● Antiepileptics (continued)
   concentration of carbamazepine; plasma concentration of sertraline possibly reduced by phenytoin, also plasma concentration of phenytoin possibly increased; plasma concentration of paroxetine reduced by phenytoin and primidone; fluoxetine and fluvoxamine increase plasma concentration of phenytoin
Antihistamines: antidepressant effect of SSRIs possibly antagonised by cyproheptadine
● Antimalarials: avoidance of antidepressants advised by manufacturer of artether/lumefantrine
Antipsychotics: fluoxetine increases plasma concentration of darifenacin and procyclidine
Antipsychotics: avoidance of fluoxetine, fluvoxamine or sertraline advised by manufacturer of droperidol (risk of ventricular arrhythmias); fluoxetine increases plasma concentration of clozapine, haloperidol and risperidone; fluvoxamine possibly increases plasma concentration of haloperidol; paroxetine inhibits metabolism of perphenazine (reduce dose of perphenazine); fluoxetine and paroxetine possibly inhibit metabolism of aripiprazole (reduce dose of aripiprazole); citalopram possibly increases plasma concentration of clozapine (increased risk of toxicity); fluvoxamine, paroxetine and sertraline increase plasma concentration of clozapine; fluvoxamine increases plasma concentration of olanzapine; SSRIs possibly increase plasma concentration of olanzapine
● Antivirals: plasma concentration of paroxetine and sertraline possibly reduced by darunavir; plasma concentration of paroxetine possibly reduced by ritonavir; plasma concentration of SSRIs possibly increased by ritonavir
● Anxiolytics and Hypnotics: fluoxetine increases plasma concentration of alprazolam; fluvoxamine increases plasma concentration of some benzodiazepines; fluvoxamine increases plasma concentration of temazepam; fluvoxamine and paroxetine possibly increase plasma concentration of olanzapine; SSRIs possibly increase plasma concentration of olanzapine
● Antiparkinsonians: avoid concomitant use; fluoxetine and paroxetine increase plasma concentration of dopamine; fluoxetine possibly increases plasma concentration of dopamine

Appendix 1: Interactions

BNF 61

808 Appendix 1: Interactions
Antidepressants, SSRI
- Dopaminergics (continued)
  2 weeks after stopping selegiline: increased risk of hypertension and CNS excitation when fluvoxamine or sertraline given with selegiline (selegiline should not be started until 1 week after stopping fluvoxamine or sertraline, avoid fluvoxamine or sertraline for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when fluoxetine given with selegiline (selegiline should not be started until 5 weeks after stopping fluoxetine, avoid fluoxetine for 2 weeks after stopping selegiline); avoidance of citalopram and escitalopram advised by manufacturer of selegiline
- Norepinephrine Antagonists: fluoxetine and paroxetine possibly inhibit metabolism of clomipramine to active metabolite (avoid concomitant use)
- SHT, Agonists: fluvoxamine inhibits the metabolism of noradrenaline; increased risk of CNS toxicity when citalopram, escitalopram, fluoxetine, fluvoxamine or paroxetine given with sumatriptan; CNS toxicity reported when sertraline given with sumatriptan; fluvoxamine possibly inhibits metabolism of zolmitriptan (reduce dose of zolmitriptan)
- Lithium: Increased risk of CNS effects when SSRIs given with lithium (lithium toxicity reported)
- Muscle Relaxants: fluvoxamine increases plasma concentration of galantamine
- Ranolazine: paroxetine increases plasma concentration of ranolazine
- Rofumilast: fluvoxamine inhibits the metabolism of rofumilast
- Sympathomimetics: metabolism of SSRIs possibly inhibited by methylphenidate
- Theophylline: fluvoxamine increases plasma concentration of theophylline (concomitant use should usually be avoided, but where not possible halve theophylline dose and monitor plasma-theophylline concentration)
- Ulcer-healing Drugs: plasma concentration of citalopram, escitalopram and sertraline increased by omeprazole; plasma concentration of Lansoprazole; plasma concentration of escitalopram increased by omeprazole
- Antidepressants, SSRI (related) see Duloxetine and Venlafaxine
- Antidepressants, Tricyclic
- Adrenergic Neurone Blockers: tricyclics antagonise hypotensive effect of adrenergic neurone blockers
- Alcohol: increased sedative effect when tricyclics given with alcohol
- Alpha2-adrenoceptor Stimulants: avoidance of tricyclics advised by manufacturer of apraclonidine and brimonidine
- Anaesthetics, General: increased risk of arrhythmias and hypotension when tricyclics given with general anaesthetics
- Analgesics: increased risk of CNS toxicity when tricyclics given with tramadol; side-effects possibly increased when tricyclics given with nefopam; sedative effects possibly increased when tricyclics given with opioid analgesics
- Anti-arrhythmics: increased risk of ventricular arrhythmias when tricyclics given with disopyramide or flecainide; avoidance of tricyclics advised by manufacturer of disopyramide (risk of ventricular arrhythmias); increased risk of arrhythmias when tricyclics given with propranolone
- Anti-bacterials: increased risk of ventricular arrhythmias when tricyclics given with moxifloxacin—avoid concomitant use

Antidepressants, Tricyclic (continued)
- Anticoagulants: tricyclics may enhance or reduce anticoagulant effect of coumarins
- Antidepressants: increased risk of serotoninergic effects when amitriptyline or clomipramine given with duloxetine; increased risk of hypertension and CNS excitation when tricyclics given with MAOIs, tricyclics should not be started until 2 weeks after stopping MAOIs (3 weeks if starting clomipramine or imipramine), also MAOIs should not be started for at least 1–2 weeks after stopping tricyclics (3 weeks in the case of clomipramine or imipramine); after stopping tricyclics do not start moclobemide for at least 1 week; plasma concentration of some tricyclics increased by SSRIs; plasma concentration of amitriptyline reduced by St John’s wort
- Antiepileptics: tricyclics antagonise anticonvulsant effect of antiepileptics (convulsive threshold lowered); metabolism of tricyclics accelerated by carbamazepine (reduced plasma concentration and reduced effect); plasma concentration of tricyclics possibly reduced by phenytoin; tricyclics antagonises anticonvulsant effect of primidone (convulsive threshold lowered), also metabolism of tricyclics possibly accelerated (reduced plasma concentration) Antifungals: plasma concentration of tricyclics possibly increased by terbinafine
- Antihistamines: increased antimuscarinic and sedative effects when tricyclics given with antihistamines
- Antimalarials: avoidance of antidepressants advised by manufacturer of arteether/lumefantrine Antimuscarinics: increased risk of antimuscarinic side-effects when tricyclics given with antimuscarinics
- Antipsychotics: plasma concentration of tricyclics increased by antipsychotics—possibly increased risk of ventricular arrhythmias; avoidance of tricyclics advised by manufacturer of clozapine; increased risk of antimuscarinic side-effects when tricyclics given with phenothiazines; increased risk of ventricular arrhythmias when tricyclics given with pimozide—avoid concomitant use
- Antivirals: plasma concentration of tricyclics possibly increased by ritonavir; increased risk of ventricular arrhythmias when tricyclics given with saquinavir—avoid concomitant use Antioxidants and Hypnotics: increased sedative effect when tricyclics given with anxiolytics and hypnotics
- Atomoxetine: increased risk of ventricular arrhythmias when tricyclics given with atomoxetine; possible increased risk of convulsions when antidepressants given with atomoxetine
- Barbiturates: tricyclics antagonises anticonvulsant effect of barbiturates (convulsive threshold lowered), also metabolism of tricyclics possibly accelerated (reduced plasma concentration)
- Beta-blockers: plasma concentration of imipramine given with labetalol and propranolol; increased risk of ventricular arrhythmias when tricyclics given with metoprolol
- Bupropion: plasma concentration of tricyclics possibly increased by bupropion (possible increased risk of convulsions)
- Calcium-channel Blockers: plasma concentration of tricyclics possibly increased by diltiazem and verapamil; plasma concentration of imipramine increased by diltiazem and verapamil
- Cannabis Extract: possible increased risk of hypertension and tachycardia when tricyclics given with cannabis extract
- Clonidine: tricyclics antagonise hypotensive effect of clonidine, also increased risk of hypertension on clonidine withdrawal
- Cytotoxics: increased risk of ventricular arrhythmias when amitriptyline or clomipramine given with arsenic trioxide
- Disopyramide: possible increased risk of ventricular arrhythmias when tricyclics given with disopyramide
Antidepressants, Tricyclic (continued)

Disulfiram: metabolism of tricyclics inhibited by disulfiram (increased plasma concentration); concomitant amitriptyline reported to increase disulfiram reaction with alcohol

Diuretics: increased risk of postural hypotension when tricyclics given with diuretics

Dopaminergics: caution with tricyclics advised by manufacturer of entacapone; increased risk of CNS toxicity when tricyclics given with rasagline; CNS toxicity reported when tricyclics given with selegiline

Histamine: tricyclics theoretically antagonise effects of histamine—manufacturer of histamine advises avoid concomitant use

Lithium: risk of toxicity when tricyclics given with lithium

Moxonidine: tricyclics possibly antagonise hypotensive effect of moxonidine (manufacturer of moxonidine advises avoid concomitant use)

Muscle Relaxants: tricyclics enhance muscle relaxant effect of baclofen

Nortriptyline: tricyclics possibly enhance hypotensive effect of nicardipine

Nitrites: tricyclics reduce effects of sublingual tablets of nitrates (failure to dissolve under tongue owing to dry mouth)

Oestrogens: antidepressant effect of tricyclic-related antidepressants possibly increased by oestrogens (but side-effects of tricyclics possibly increased due to increased plasma concentration)

Pentamidine isetionate: increased risk of venricular arrhythmias when tricyclics given with pentamidine isetionate

Sodium Oxybate: increased risk of side-effects when tricyclics given with sodium oxybate

Sympathomimetics: increased risk of hypertension and arrhythmias when tricyclics given with adrenaline (epinephrine) (but local anaesthetics with adrenaline appear to be safe); metabolism of tricyclics possibly inhibited by methylphenidate; increased risk of hypertension and arrhythmias when tricyclics given with noradrenaline (norepinephrine)

Thyroid Hormones: effects of tricyclics possibly enhanced by thyroid hormones; effects of amitriptyline and imipramine enhanced by thyroid hormones

Ulcer-healing Drugs: plasma concentration of tricyclics possibly increased by cimetidine; metabolism of amitriptyline, doxepin, imipramine and nortriptyline inhibited by cimetidine (increased plasma concentration)

Antidepressants, Tricyclic (related)

Alcohol: increased sedative effect when tricyclic-related antidepressants given with alcohol

Alpha₂-adrenoceptor Stimulants: avoidance of tricyclic-related antidepressants advised by manufacturer of apraclonidine and brimonidine

Anticoagulants: trazodone may enhance or reduce anticoagulant effect of warfarin

Antidepressants: tricyclic-related antidepressants should not be started until 2 weeks after stopping tricyclic-related antidepressants; after stopping tricyclic-related antidepressants do not start moclobemide for at least 1 week

Antiepileptics: tricyclic-related antidepressants possibly antagonise anticonvulsant effect of antiepileptics (convulsive threshold lowered); metabolism of mianserin accelerated by phenytoin (reduced effect); effects of sulfonylureas rarely enhanced by sulfinpyrazone—manufacturer advises avoid concomitant use

Antidepressants: hypoglycaemic effect of antidiabetics possibly enhanced by MAOIs; hypoglycaemic effect of insulin, metformin and sulfonylureas possibly enhanced by diuretics; hypoglycaemic effect of acarbose possibly increased by topiramate or 4 hours after exenatide injection, or taken with a meal when exenatide is not administered, to minimise possible interference with absorption

ACE Inhibitors: hypoglycaemic effect of insulin, metformin and sulfonylureas possibly enhanced by ACE inhibitors

Alcohol: hypoglycaemic effect of antidiabetics enhanced by alcohol; increased risk of lactic acidosis when metformin given with alcohol

Anabolic Steroids: hypoglycaemic effect of anti-diabetics possibly enhanced by anabolic steroids

Analgesics: effects of sulfonylureas possibly enhanced by NSAIDs

Anti-arrhythmics: hypoglycaemic effect of glitazones, insulin and metformin possibly enhanced by diuretics

Antibacterials: hypoglycaemic effect of acarbose possibly increased by neomycin, also severity of gastrointestinal effects increased; effects of repaglinide enhanced by clarithromycin; effects of sulfonylureas possibly enhanced by rifampicin; metabolism of tolbutamide accelerated by rifampicin (reduced effect); effects of sulfonylureas rarely enhanced by sulfonamides and trimethoprim; hypoglycaemic effect of sulfonylureas possibly enhanced by tetracyclines; hypoglycaemic effect of repaglinide possibly enhanced by trimethoprim—manufacturer advises avoid concomitant use

Anticonvulsants: exenatide possibly enhances anticonvulsant effect of warfarin; hypoglycaemic effect of sulfonylureas possibly enhanced by cimtemidine, also possible change to anticonvulsant effect

Antidepressants: hypoglycaemic effect of anti-diabetics possibly enhanced by MAOIs; hypoglycaemic effect of insulin, metformin and sulfonylureas enhanced by MAOIs

Antiepileptics: tolbutamide transiently increases plasma concentration of phenytoin (possibility of toxicity); plasma concentration of glibenclamide possibly reduced by topiramate; plasma concentration of metformin possibly increased by topiramate
Antidiabetics (continued)
- Antifungals: plasma concentration of sulfonylureas increased by fluconazole and miconazole; hypoglycaemic effect of glimepiride and glipizide enhanced by miconazole—avoid concomitant use; hypoglycaemic effect of nateglinide possibly increased by gemfibrozil; plasma concentration of sulfonylureas possibly enhanced by voriconazole

Antihistamines: thrombocyte count depressed when metformin given with ketotifen (manufacturer of ketotifen advises avoid concomitant use)

Antipsychotics: hypoglycaemic effect of sulfonylureas possibly antagonised by phenothiazines

Antivirals: plasma concentration of tolbutamide possibly increased by ritonavir

Aprepitant: plasma concentration of tolbutamide reduced by aprepitant

Beta-blockers: warning signs of hypoglycaemia (such as tremor) with antidiabetics may be masked when given with beta-blockers; hypoglycaemic effect of insulin enhanced by beta-blockers

Bosentan: increased risk of hepatotoxicity when glibenclamide given with bosentan—avoid concomitant use

Calcium-channel Blockers: glucose tolerance occasionally impaired when insulin given with nifedipine

Cardiac Glycosides: acarbose possibly reduces plasma concentration of digoxin; sitagliptin increases plasma concentration of digoxin

Ciclosporin: hypoglycaemic effect of repaglinide possibly enhanced by ciclosporin

Corticosteroids: hypoglycaemic effect of antidiabetics antagonised by corticosteroids

Cytoxotics: avoidance of repaglinide advised by manufacturer of lapatinib

Deferasirox: plasma concentration of repaglinide increased by deferasirox

Diazoxide: hypoglycaemic effect of antidiabetics antagonised by diazoxide

Diuretics: hypoglycaemic effect of antidiabetics antagonised by loop diuretics and thiazides and related diuretics

Hormone Antagonists: requirements for insulin, metformin, repaglinide and sulfonylureas possibly reduced by lanreotide; requirements for insulin, metformin, repaglinide and sulfonylureas possibly reduced by octreotide

Leflunomide: hypoglycaemic effect of tolbutamide possibly enhanced by leflunomide

Lipid-regulating Drugs: absorption of glibenclamide reduced by colesevelam; hypoglycaemic effect of acarbose possibly enhanced by colestyramine; hypoglycaemic effect of nateglinide possibly enhanced by gemfibrozil; increased risk of severe hypoglycaemia when repaglinide given with gemfibrozil—avoid concomitant use; plasma concentration of glibenclamide possibly increased by fluvastatin; may be improved effect when insulin or sulfonylureas given with fibrates

Oestrogens: hypoglycaemic effect of antidiabetics antagonised by oestrogens

Orlistat: avoidance of acarbose advised by manufacturer of orlistat

Pancreatins: hypoglycaemic effect of acarbose antagonised by pancreatin

Progestogens: hypoglycaemic effect of antidiabetics antagonised by progestogens

Sulfinpyrazone: effects of sulfonylureas enhanced by sulfinpyrazone

Testosterone: hypoglycaemic effect of antidiabetics possibly enhanced by testosterone

Ulcer-healing Drugs: excretion of metformin reduced by cimetidine (increased plasma concentration)

Antidiabetics Ulcer-healing Drugs (continued)
- Antihistamines: thrombocyte count depressed when metformin given with ketotifen (manufacturer of ketotifen advises avoid concomitant use)

Antipsychotics: hypoglycaemic effect of sulfonylureas enhanced by fluphenazine and mepitolone

Antivirals: plasma concentration of tolbutamide possibly increased by ritonavir

Aprepitant: plasma concentration of tolbutamide reduced by aprepitant

Beta-blockers: warning signs of hypoglycaemia (such as tremor) with antidiabetics may be masked when given with beta-blockers; hypoglycaemic effect of insulin enhanced by beta-blockers

Bosentan: increased risk of hepatotoxicity when glibenclamide given with bosentan—avoid concomitant use

Calcium-channel Blockers: glucose tolerance occasionally impaired when insulin given with nifedipine

Cardiac Glycosides: acarbose possibly reduces plasma concentration of digoxin; sitagliptin increases plasma concentration of digoxin

Ciclosporin: hypoglycaemic effect of repaglinide possibly enhanced by ciclosporin

Corticosteroids: hypoglycaemic effect of antidiabetics antagonised by corticosteroids

Cytoxotics: avoidance of repaglinide advised by manufacturer of lapatinib

Deferasirox: plasma concentration of repaglinide increased by deferasirox

Diazoxide: hypoglycaemic effect of antidiabetics antagonised by diazoxide

Diuretics: hypoglycaemic effect of antidiabetics antagonised by loop diuretics and thiazides and related diuretics

Hormone Antagonists: requirements for insulin, metformin, repaglinide and sulfonylureas possibly reduced by lanreotide; requirements for insulin, metformin, repaglinide and sulfonylureas possibly reduced by octreotide

Leflunomide: hypoglycaemic effect of tolbutamide possibly enhanced by leflunomide

Lipid-regulating Drugs: absorption of glibenclamide reduced by colesevelam; hypoglycaemic effect of acarbose possibly enhanced by colestyramine; hypoglycaemic effect of nateglinide possibly enhanced by gemfibrozil; increased risk of severe hypoglycaemia when repaglinide given with gemfibrozil—avoid concomitant use; plasma concentration of glibenclamide possibly increased by fluvastatin; may be improved effect when insulin or sulfonylureas given with fibrates

Oestrogens: hypoglycaemic effect of antidiabetics antagonised by oestrogens

Orlistat: avoidance of acarbose advised by manufacturer of orlistat

Pancreatins: hypoglycaemic effect of acarbose antagonised by pancreatin

Progestogens: hypoglycaemic effect of antidiabetics antagonised by progestogens

Sulfinpyrazone: effects of sulfonylureas enhanced by sulfinpyrazone

Testosterone: hypoglycaemic effect of antidiabetics possibly enhanced by testosterone

Ulcer-healing Drugs: excretion of metformin reduced by cimetidine (increased plasma concentration)
Antifungals, Imidazole

- Antipsychotics (continued)
  - risk of ventricular arrhythmias when imidazoles given with pimozide—avoid concomitant use; imidazoles possibly increase plasma concentration of quetiapine (reduce dose of quetiapine)
- Antivirals: plasma concentration of both drugs increased when ketoconazole given with darunavir; plasma concentration of ketoconazole increased by fosamprenavir (also plasma concentration of fosamprenavir possibly increased); ketoconazole increases plasma concentration of enfuvirtide and maraviroc (consider reducing dose of enfuvirtide and maraviroc); plasma concentration of ketoconazole reduced by nefazodone—avoid concomitant use; combination of ketoconazole with ritonavir may increase plasma concentration of either drug (or both); ketoconazole increases plasma concentration of saquinavir; imidazoles possibly increase plasma concentration of saquinavir
- Anxiolytics and Hypnotics: ketoconazole increases plasma concentration of alprazolam; ketoconazole increases plasma concentration of midazolam (risk of prolonged sedation)
- Aprepitant: ketoconazole increases plasma concentration of aprepitant
- Bosentan: ketoconazole increases plasma concentration of bosentan
- Calcium-channel Blockers: ketoconazole inhibits metabolism of verapamil (increased plasma concentration); avoidance of ketoconazole advised by manufacturer of lercanidipine; ketoconazole possibly inhibits metabolism of dihydropyridines (increased plasma concentration)
- Ciclosporin: ketoconazole inhibits metabolism of ciclosporin (increased plasma concentration); miconazole possibly inhibits metabolism of ciclosporin (increased plasma concentration)
- Cilostazol: ketoconazole increases plasma concentration of cilostazol (consider reducing dose of cilostazol)
- Cinnarizine: ketoconazole inhibits metabolism of cinnarizine (increased plasma concentration)
- Citalopram: ketoconazole increases plasma concentration of citalopram (increased plasma concentration)
- Colchicine: ketoconazole possibly increases risk of colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: ketoconazole possibly inhibits metabolism of corticosteroids; ketoconazole increases plasma concentration of inhaled and oral budesonide; ketoconazole increases plasma concentration of active metabolite of budesonide; ketoconazole inhibits the metabolism of methylprednisolone; ketoconazole increases plasma concentration of inhaled mometasone
- Cytoxics: ketoconazole possibly increases plasma concentration of daсatinib; ketoconazole inhibits metabolism of erlotinib and amsacrine (increased plasma concentration); ketoconazole increases plasma concentration of everolimus, lapatinib and nilotinib—avoid concomitant use; ketoconazole increases plasma concentration of bortezomib and imatinib; avoidance of ketoconazole advised by manufacturer of pazopanib; ketoconazole increases plasma concentration of active metabolite of tienilic acid—avoid concomitant use; in vitro studies suggest a competitive interaction between ketoconazole and doxetaxel (consult doxetaxel product literature); ketoconazole reduces plasma concentration of vinorelbine (but concentration of active metabolite of vinorelbine increased)—avoid concomitant use; ketoconazole increases plasma concentration of vinflunine—manufacturer of vinflunine advises avoid concomitant use
- Diuretics: ketoconazole increases plasma concentration of eplerenone—avoid concomitant use
- Antifungals, Imidazole (continued)
  - Domperidone: ketoconazole possibly increases risk of arrhythmias with domperidone
  - Ergot Alkaloids: increased risk of ergotism when imidazoles given with ergotamine and methysergide—avoid concomitant use
  - 5HT, Agonists: ketoconazole increases plasma concentration of almotriptan (increased risk of toxicity); ketoconazole increases plasma concentration of eletriptan (risk of toxicity)—avoid concomitant use
  - Ivermectin: ketoconazole increases plasma concentration of ivermectin—avoid concomitant use
  - Lanthanum: absorption of ketoconazole possibly reduced by lanthanum (give at least 2 hours apart)
  - Lipid-regulating Drugs: possible increased risk of myopathy when imidazoles given with atorvastatin or simvastatin; increased risk of myopathy when ketoconazole given with atorvastatin (avoid concomitant use); possible increased risk of myopathy when miconazole given with simvastatin—avoid concomitant use
  - Oestrone: anecdotal reports of contraceptive failure when imidazoles given with oestrone
  - Parasympathomimetics: ketoconazole increases plasma concentration of galantamine
  - Ranolazine: ketoconazole increases plasma concentration of ranolazine—avoid concomitant use
  - Retinoids: ketoconazole increases plasma concentration of retinoids—reduce initial dose of sildenafil
  - Sirolimus: ketoconazole increases plasma concentration of sirolimus—avoid concomitant use; miconazole increases plasma concentration of sirolimus
  - Tacrolimus: imidazoles possibly increase plasma concentration of tacrolimus; ketoconazole increases plasma concentration of tacrolimus
  - Tadalafil: ketoconazole increases plasma concentration of tadalafil—manufacturer of tadalafil advises avoid concomitant use
  - Theophylline: ketoconazole possibly increases plasma concentration of theophylline
  - Tolvaptan: ketoconazole increases plasma concentration of tolvaptan
  - Ulcer-healing Drugs: absorption of ketoconazole reduced by histamine H₂-antagonists, proton pump inhibitors and sucralfate
  - Vardenafil: ketoconazole increases plasma concentration of vardenafil—manufacturer of vardenafil advises avoid concomitant use
  - Vitamins: ketoconazole possibly increases plasma concentration of vitamin K

Antifungals, Polyene

Note: In general, fluconazole interactions relate to multiple-dose treatment

- Analgesics: fluconazole increases plasma concentration of celecoxib (halve dose of celecoxib); voriconazole increases plasma concentration of diclofenac and ibuprofen; fluconazole increases plasma concentration of parecoxib (reduce dose of parecoxib); voriconazole increases plasma concentration of alfentanil and methadone—consider reducing dose of alfentanil and methadone; fluconazole inhibits metabolism of alfentanil (risk of prolonged or delayed respiratory depression); irtraconazole possibly inhibits metabolism of alfentanil; triazoles possibly increase plasma concentration of entanyl
- Antacids: absorption of itraconazole reduced by antacids
- Anti-arrhythmics: manufacturer of itraconazole advises avoid concomitant use with disopyramide; avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of dronedarone
Antifungals, Triazole (continued)

- Antibacterials: plasma concentration of itraconazole increased by clarithromycin; triazoles possibly increase plasma concentration of efavirenz (increased risk of uveitis—reduce rifabutin dose); posaconazole increases plasma concentration of efavirenz (also plasma concentration of posaconazole reduced); voriconazole increases plasma concentration of efavirenz, also rifabutin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for rifabutin toxicity); fluconazole increases plasma concentration of efavirenz; posaconazole and voriconazole possibly increase plasma concentration of efavirenz.

- Anticoagulants: fluconazole, itraconazole and voriconazole enhance anticoagulant effect of coumarins; avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of voriconazole and voriconazole (St John’s wort—avoid concomitant use).

- Anti-diabetics: posaconazole possibly enhances hypoglycaemic effect of glipizide; fluconazole possibly enhances hypoglycaemic effect of nateglinide; itraconazole possibly enhances hypoglycaemic effect of repaglinide; fluconazole increases plasma concentration of sulfonylureas; voriconazole possibly increases plasma concentration of sulfonylureas.

- Antiepileptics: fluconazole possibly increases plasma concentration of carbamazepine; plasma concentration of voriconazole possibly reduced by carbamazepine and primidone—avoid concomitant use; plasma concentration of voriconazole and posaconazole possibly reduced by carbamazepine; voriconazole increases plasma concentration of phenytoin (consider reducing dose of phenytoin); voriconazole increases plasma concentration of phenytoin, also phenytoin reduces plasma concentration of voriconazole and also monitor for phenytoin toxicity; plasma concentration of posaconazole possibly reduced by primidone.

Antifungals: triazoles possibly antagonise effects of amphotericin; plasma concentration of itraconazole increased by micafungin (consider reducing dose of itraconazole).

- Anti-histamines: itraconazole inhibits metabolism of mizolastine—avoid concomitant use.

- Antimalarials: avoidance of triazoles advised by manufacturer of quinidine.

- Antithrombinics: avoidance of itraconazole advised by manufacturer of darifenacin and tolterodine; manufacturer of fesoterodine advises dose reduction when itraconazole given with fesoterodine—consult fesoterodine product literature; itraconazole increases plasma concentration of solifenacin.

- Antipsychothics: itraconazole possibly increases plasma concentration of aripiprazole (reduce dose of aripiprazole); increased risk of ventricular arrhythmias when triazoles given with pimozide—avoid concomitant use; fluconazole increases plasma concentration of quetiapine (reduce dose of quetiapine).

- Antivirals: posaconazole increases plasma concentration of efavirenz; plasma concentration of itraconazole and posaconazole reduced by efavirenz; plasma concentration of voriconazole reduced by efavirenz, also plasma concentration of efavirenz increased (increase voriconazole dose and reduce efavirenz dose); plasma concentration of both drugs may increase when itraconazole given with fasmpenavir; itraconazole increases plasma concentration of efavirenz (consider reducing dose of efavirenz); plasma concentration of itraconazole possibly reduced by nevirapine—consider increasing dose of itraconazole; fluconazole increases plasma concentration of efavirenz and voriconazole possibly increase plasma concentration of saquinavir; fluconazole increases plasma concentration of efavirenz (increased risk of toxicity).
Antifungals, Triazole
- Cytotoxic (continued)
  - plasma concentration of vinflunine—manufactur er of vinflunine advises avoid concomitant use
- Diuretics: fluconazole increases plasma concentration of eplerenone (reduce dose of eplerenone); itracon azole increases plasma concentration of eplerenone—avoid concomitant use; plasma concentration of fluconazole increased by hydrochlorothiazide
- Ergot Alkaloids: increased risk of ergotism when triazoles given with ergotamine and methyprylon—avoid concomitant use
- SHT, Agonists: itraconazole increases plasma concentration of dihydroergotamine—risk of toxicity—avoid concomitant use
- Itraconazole: fluconazole increases plasma concentration of itraconazole; fluconazole possibly increases plasma concentration of itraconazole—avoid concomitant use
- Ulcer-healing Drugs:
  - Theophylline:
    - increased risk of myopathy when itraconazole or posaconazole given with atorvastatin or simvastatin; increased risk of myopathy when itraconazole or posaconazole given with atorvastatin (avoid concomitant use)
- Lipid-regulating Drugs:
  - Ranolazine:
    - increased plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use
  - Simvastatin:
    - increased risk of myopathy when itraconazole or posaconazole given with atorvastatin or simvastatin; increased risk of myopathy when itraconazole or posaconazole given with atorvastatin (avoid concomitant use)
- Antifungals, Triazole (continued)
  - Voriconazole:
    - increased by oestrogens
    - Progestogens:
      - plasma concentration of voriconazole possibly increased by progestogens
- Alcohol:
  - increased sedative effect when antihistamines given with alcohol (possibly less effect with non-sedating antihistamines)
  - Sedative interactions apply to a lesser extent to the non-sedating antihistamines. Interactions do not generally apply to antihistamines used for topical action (including inhalation)
  - Alcohol: increased sedative effect when antihistamines given with alcohol (possibly less effect with non-sedating antihistamines)
  - Analgesics: sedative effects possibly increased when sedating antihistamines given with opioid analgesics
  - Antacid: absorption of fexofenadine reduced by antacids
Antimuscarinics (continued)

Analgesics: increased risk of antimuscarinic side-effects when antimuscarinics given with nefopam.

Anti-arrhythmics: increased risk of ventricular arrhythmias when tolterodine given with omeprazole, disopyramide or etilefrine; increased risk of antimuscarinic side-effects when antimuscarinics given with disopyramide.

Antibacterials: manufacturer of fesoterodine advises dose reduction when fesoterodine given with clarithromycin and telithromycin—consult fesoterodine product literature; manufacturer of tolterodine advises avoid concomitant use with clarithromycin and erythromycin; plasma concentration of darifenacin possibly increased by erythromycin; plasma concentration of active metabolite of fesoterodine reduced by rifampicin.

Antidepressants: plasma concentration of darifenacin and procyclidine increased by paroxetine; increased risk of antimuscarinic side-effects when antimuscarinics given with MAOIs or tricyclics; possibly increased antimuscarinic side-effects when antimuscarinics given with tricyclic-related antidepressants.

Antifungals: antimuscarinics reduce absorption of itraconazole; manufacturer of fesoterodine advises dose reduction when fesoterodine given with itraconazole and ketoconazole—consult fesoterodine product literature; plasma concentration of darifenacin increased by itraconazole and ketoconazole—avoid concomitant use; plasma concentration of solifenacin increased by itraconazole and ketoconazole; manufacturer of tolterodine advises avoid concomitant use with itraconazole and ketoconazole; manufacturer of darifenacin advises avoid concomitant use with itraconazole.

Antihistamines: increased risk of antimuscarinic side-effects when antimuscarinics given with antihistamines.

Antipsychotics: antimuscarinics possibly reduce plasma concentration of phenothiazines, but risk of antimuscarinic side-effects increased.

Antivirals: manufacturer of fesoterodine advises dose reduction when fesoterodine given with atazanavir, indinavir, nelfinavir, ritonavir and saquinavir; consult fesoterodine product literature; manufacturer of darifenacin advises avoid concomitant use with atazanavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir and tpranavir; manufacturer of tolterodine advises avoid concomitant use with fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir and saquinavir; plasma concentration of solifenacin increased by nelfinavir and ritonavir.

Beta-blockers: increased risk of ventricular arrhythmias when tolterodine given with betablockers.

Calcium-channel Blockers: manufacturer of darifenacin advises avoid concomitant use with verapamil.

Cardiac Glycosides: darifenacin possibly increases plasma concentration of digoxin.

Ciclosporin: manufacturer of darifenacin advises avoid concomitant use with ciclosporin.

Dopemimetics: antimuscarinics possibly reduce absorption of levodopa.

Memantine: effects of antimuscarinics possibly enhanced by memantine.

Metoclopramide: antimuscarinics enhance effects of metoclopramide on gastrointestinal activity.

Nitrates: antimuscarinics possibly reduce effects of sublingual tablets of nitrates (failure to dissolve under tongue owing to dry mouth).

Parasympathomimetics: antimuscarinics antagonise effects of parasympathomimetics.

Antipsychotics

Note: Increased risk of toxicity with myelosuppressive drugs.

Note: Avoid concomitant use of clozapine with drugs that have a substantial potential for causing agranulocytosis.

ACE Inhibitors: enhanced hypotensive effect when antipsychotics given with ACE inhibitors.

Adrenergic Neurone Blockers: enhanced hypotensive effect when phenothiazines given with adrenergic neurone blockers; higher doses of clonazepam antagonise hypotensive effect of adrenergic neurone blockers; haloperidol antagonises hypotensive effect of adrenergic neurone blockers.

Adsorbents: absorption of phenothiazines possibly reduced by kaolin.

Alcohol: increased sedative effect when antipsychotics given with alcohol.

Alpha-blockers: enhanced hypotensive effect when antipsychotics given with alpha-blockers.

Anaesthetics, General: droperidol enhances effects of thiopental; enhanced hypotensive effect when antipsychotics given with general anaesthetics.

Analgesics: possible severe drowsiness when haloperidol given with indometacin; increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with methadone; increased risk of ventricular arrhythmias when amisulpride given with methadone—avoid concomitant use; increased risk of convulsions when antipsychotics given with tramadol; enhanced hypotensive and sedative effects when antipsychotics given with opioid analgesics.

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when antipsychotics given with angiotensin-II receptor antagonists.

Antacids: absorption of phenothiazines and sulpiride reduced by antacids.

Anti-arrhythmics: increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with anti-arrhythmics that prolong the QT interval; increased risk of ventricular arrhythmias when amisulpride, droperidol, haloperidol, phenothiazines, pimozide or zuclopenthixol given with amiodarone—avoid concomitant use; increased risk of ventricular arrhythmias when benperidol given with amiodarone—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when sulpiride given with amiodarone or disopyramide; possible increased risk of ventricular arrhythmias when haloperidol given with disopyramide—avoid concomitant use; increased risk of ventricular arrhythmias when amisulpride, droperidol, pimozide or zuclopenthixol given with disopyramide—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines given with disopyramide; avoidance of phenothiazines advised by manufacturer of droperidone (risk of ventricular arrhythmias); increased risk of arrhythmias when clozapine given with fexofenadine.

Antibacterials: increased risk of ventricular arrhythmias when pimozide given with clarithromycin, moxifloxacin or telithromycin—avoid concomitant use; increased risk of ventricular arrhythmias when amisulpride given with erythromycin—avoid concomitant use; plasma concentration of clozapine possibly increased by erythromycin (possible increased risk of convulsions); possible increased risk of ventricular arrhythmias when pimozide given with erythromycin—avoid concomitant use; increased risk of ventricular arrhythmias when sulpiride given with parerental erythromycin; increased risk of ventricular arrhythmias when zuclopenthixol given with parerental erythromycin—avoid concomitant use; plasma concentration of clozapine increased by cipofloxacin; plasma concentration of olanzapine possibly increased by cipofloxacin; increased risk of ventricular arrhythmias when droperidol, halo-
Antiepileptics: Antiepileptics

Antipsychotics: Antipsychotics (continued)

Antimalarials: Antimalarials

Antifungals: Antifungals (continued)

Antipsychotics (continued)

Antipsychotics: Antipsychotics (continued)

Antidepressants: Antidepressants

Antibacterials: Antibacterials (continued)
Antipsychotics (continued)

- Anxiety and Hypnotics: increased sedative effect when antipsychotics given with anxiolytics and hypnotics; serious adverse events reported with concomitant use of clozapine and lorazepam (causality not established); increased risk of hypotension, bradycardia and respiratory depression when intramuscular olanzapine given with paroxetine; plasma concentration of haloperidol increased by buspirone

- Atomoxetine: increased rate of ventricular arrhythmias when antipsychotics that prolong the QT interval given with atomoxetine

- Barbiturates: antipsychotics antagonise anti-convulsant effect of barbiturates (convulsive threshold lowered); metabolism of haloperidol accelerated by phenobarbital (reduced plasma concentration); plasma concentration of both drugs reduced when chlorpromazine given with phenobarbital; plasma concentration of aripiprazole possibly reduced by phenobarbital—increased dose of aripiprazole

- Beta-blockers: enhanced hypotensive effect when phenothiazines given with beta-blockers; plasma concentration of both drugs may increase when chlorpromazine given with propranolol; increased risk of ventricular arrhythmias when amisulpride, phenothiazines, pimozide or sulpiride given with sotalol; increased risk of ventricular arrhythmias when droperidol or zuclopenthixol given with sotalol—avoid concomitant use; possible increased risk of ventricular arrhythmias when haloperidol given with sotalol—avoid concomitant use

- Calcium-channel Blockers: enhanced hypotensive effect when antipsychotics given with calcium-channel blockers

- Clonidine: enhanced hypotensive effect when phenothiazines given with clonidine

- Cytototics: avoid concomitant use of clozapine with cytotoxic effects; risk of agranulocytosis; avoidance of pimozide advised by manufacturer of lapatinib; increased risk of ventricular arrhythmias when amisulpride, phenothiazines, pimozide or sulpiride given with arsenic trioxide; increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with arsenic trioxide

- Desferrioxamine: manufacturer of levomepromazine advises avoid concomitant use with desferrioxamine; avoidance of prochlorperazine advised by manufacturer of desferrioxamine

- Diazoxide: enhanced hypotensive effect when phenothiazines given with diazoxide

- Diuretics: risk of ventricular arrhythmias with amisulpride increased by hypokalaemia caused by diuretics; risk of ventricular arrhythmias with pimozide increased by hypokalaemia caused by diuretics (avoid concomitant use); enhanced hypotensive effect when phenothiazines given with diuretics

- Dopaminergics: increased risk of extrapyramidal side-effects when antipsychotics given with amantadine; antipsychotics antagonise effects of apomorphine, levodopa and pergolide; antipsychotics antagonise hypoprolineaemic and antiparkinsonian effects of bromocriptine and cabergoline; manufacturer of amisulpride advises avoid concomitant use of levodopa (agonist of effect); avoidance of antipsychotics advised by manufacturer of pramipexole, ropinirole and rotigotine (antagonism of effect)

- Histamine: antipsychotically antagonise effects of histamine—manufacturer of histamine advises avoid concomitant use

- Hormone Antagonists: manufacturer of droperidol advises avoid concomitant use with tamoxifen (risk of ventricular arrhythmias)

Antipsychotics (continued)

- Ibravadinib: increased risk of ventricular arrhythmias when pimozone given with ibrahadinib

- Lithium: increased risk of extrapyramidal side-effects and possibly neurotoxicity when clozapine, flupenthixol, haloperidol, phenothiazines or zuclopenthixol given with lithium; possible risk of toxicity when olanzapine given with lithium; increased risk of extrapyramidal side-effects when sulpiride given with lithium

- Memantine: effects of antipsychotics possibly reduced by memantine

- Methylphenidate: enhanced hypotensive effect when antipsychotics given with methylphenidate (also increased risk of extrapyramidal effects)

- Metoclopramide: increased risk of extrapyramidal side-effects when antipsychotics given with metoclopramide

- Moxonidine: enhanced hypotensive effect when phenothiazines given with moxonidine

- Muscle Relaxants: promazine possibly enhances effects of suxamethonium

- Nitrates: enhanced hypotensive effect when phenothiazines given with nitrates

- Penicillamine: avoid concomitant use of clozapine with penicillamine (increased risk of agranulocytosis)

- Pentamidine isetionate: increased risk of ventricular arrhythmias when amisulpride or droperidol given with pentamidine isetionate—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines given with pentamidine isetionate

- Sodium Benzoate: haloperidol possibly reduces effects of sodium benzoate

- Sodium Oxybate: antipsychotics possibly enhance effects of sodium oxybate

- Sodium Phenylbutyrate: haloperidol possibly reduces effects of sodium phenylbutyrate

- Sympathomimetics: antipsychotics antagonise hypertensive effect of sympathomimetics; antipsychotic effects of chlorpromazine possibly antagonised by dexamphetamine; side-effects of risperidone possibly increased by methylphenidate

- Tacrolimus: manufacturer of droperidol advises avoid concomitant use with tacrolimus (risk of ventricular arrhythmias)

- Tetrabenazine: increased risk of extrapyramidal side-effects when antipsychotics given with tetrabenazine

- Telbivudine, Tenofovir, Tipranavir, Valaciclovir, and Truvada: see Antivirals

- Antivirals see Abacavir, Aciclovir, Adefovir, Atazanavir, Cidofovir, Darunavir,Didanosine, Efavirenz, Emtricitabine, Etravirine, Famiclovir, Fosamprenavir, Fosarnet, Ganciclovir, Indinavir, Lamivudine, Lopinavir, Maraviroc, Nelfinavir, Nevirapine, Raltegravir, Ribavirin, Ritonavir, Saquinavir, Stavudine, Telbivudine, Tenofovir, Tipranavir, Valaciclovir, and Zidovudine

Anxiolytics and Hypnotics

- ACE Inhibitors: enhanced hypotensive effect when anxiolytics and hypnotics given with ACE inhibitors

- Adrenergic Neurome Blockers: enhanced hypotensive effect when anxiolytics and hypnotics given with adrenergic neurome blockers

- Alcohol: increased sedative effect when anxiolytics and hypnotics given with alcohol

- Alpha-blockers: enhanced hypotensive and sedative effects when anxiolytics and hypnotics given with alpha-blockers

- Anaesthetics, General: increased sedative effect when anxiolytics and hypnotics given with general anaesthetics
Anxiolytics and Hypnotics (continued)

Analgesics: metabolism of midazolam possibly inhibited by fentanyl; increased sedative effect when anxiolytics and hypnotics given with opioid analgesics.

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when anxiolytics and hypnotics given with angiotensin-II receptor antagonists
- Antihistamines: metabolism of midazolam inhibited by clarithromycin, erythromycin and telithromycin (increased plasma concentration with increased sedation); plasma concentration of buspirone increased by erythromycin (reduce dose of buspirone); metabolism of zopiclone inhibited by erythromycin; metabolism of benzodiazepines possibly accelerated by rifampicin (reduced plasma concentration); metabolism of diazepam accelerated by rifampicin (reduced plasma concentration); metabolism of zopiclone significantly reduced by rifampicin; metabolism of diazepam inhibited by isoniazid

Anticoagulants: chloral and triclofos may transiently enhance anticoagulant effect of coumarins
- Antidepressants: plasma concentration of alprazolam increased by fluoxetine; plasma concentration of melatonin increased by fluvoxamine—avoid concomitant use; plasma concentration of some benzodiazepines increased by fluvoxamine; sedative effects possibly increased when zolpidem given with sertraline; manufacturer of buspirone advises avoid concomitant use with MAOIs; avoidance of buspirone for 10 days after stopping tranylcypromine advised by manufacturer of tranylcypromine; plasma concentration of oral midazolam possibly reduced by St John’s wort; increased sedative effect when anxiolytics and hypnotics given with mirtazapine, tricyclic-related antidepressants or tricryptics

Antiepileptics: plasma concentration of midazolam reduced by carbamazepine; plasma concentration of clonazepam often reduced by carbamazepine, phenytoin and primidone; benzodiazepines possibly increased or decrease plasma concentration of phenytoin; diazepam increases or decreases plasma concentration of phenytoin; plasma concentration of progabide increased by stiripentol; clobazam possibly increases plasma concentration of valproate; plasma concentration of diazepam and lorazepam possibly increased by valproate; increased risk of side-effects when clonazepam given with valproate
- Antifungals: plasma concentration of alprazolam increased by itraconazole and ketoconazole; plasma concentration of midazolam increased by fluconazole, itraconazole and ketoconazole (risk of prolonged sedation); plasma concentration of buspirone increased by itraconazole (reduce dose of buspirone); plasma concentration of midazolam increased by posaconazole

Antihistamines: increased sedative effect when anxiolytics and hypnotics given with antihistamines
- Antipsychotics: increased sedative effect when anxiolytics and hypnotics given with antipsychotics: buspirone increases plasma concentration of haloperidol; serious adverse events reported with concomitant use of lorazepam and clozapine (causality not established); increased risk of hypotension, bradyarrhythmia and respiratory depression when par- enteral benzodiazepines given with intramuscular orlanzapine
- Anxiolytics and Hypnotics (continued)

Anxiolytics and Hypnotics

Antivirals (continued)

longed sedation—avoid concomitant use of oral midazolam); increased risk of prolonged sedation when alprazolam given with indinavir—avoid concomitant use; plasma concentration of alprazolam, diazepam, flurazepam and zolpidem possibly increased by ritonavir (risk of extreme sedation and respiratory depression—avoid concomitant use); plasma concentration of anxiolytics and hypnotics possibly increased by ritonavir; plasma concentration of buspirone increased by ritonavir (increased risk of toxicity); plasma concentration of midazolam increased by saquinavir (risk of prolonged sedation—avoid concomitant use of oral midazolam)

Aprepitant: plasma concentration of midazolam increased by aprepitant (risk of prolonged sedation)

Barbiturates: plasma concentration of clonazepam often reduced by phenobarbital

Beta-blockers: enhanced hypotensive effect when anxiolytics and hypnotics given with beta-blockers

Calcium-channel Blockers: enhanced hypotensive effect when anxiolytics and hypnotics given with calcium-channel blockers; midazolam increases absorption of lercanidipine; plasma concentration of buspirone increased by diltiazem and verapamil (reduce dose of buspirone); metabolism of midazolam inhibited by diltiazem and verapamil (increased plasma concentration with increased sedation)

Cardiac Glycosides: alprazolam increases plasma concentration of digoxin (increased risk of toxicity)

Clonidine: enhanced hypotensive effect when anxiolytics and hypnotics given with clonidine

Cytotoxics: plasma concentration of midazolam increased by milotinib

Dexefasirox: plasma concentration of midazolam possibly reduced by dexefasirox

Diazoxide: enhanced hypotensive effect when anxiolytics and hypnotics given with diazoxide

Disulfiram: metabolism of benzodiazepines inhibited by disulfiram (increased plasma concentration); excretion of midazolam possibly reduced by disulfiram

Diuretics: enhanced hypotensive effect when anxiolytics and hypnotics given with diuretics; administration of chloral or triclofos with parenteral furosemide may displace thyroid hormone from binding sites

Dopamineergics: benzodiazepines possibly antagonise effects of levodopa

Grapefruit Juice: plasma concentration of buspirone increased by grapefruit juice

Lithium: increased risk of neurotoxicity when clonazepam given with lithium

Lofexidine: increased sedative effect when anxiolytics and hypnotics given with lofexidine

Methyldopa: enhanced hypotensive effect when anxiolytics and hypnotics given with methyldopa

Moxonidine: enhanced hypotensive effect when anxiolytics and hypnotics given with moxonidine

Muscle Relaxants: increased sedative effect when anxiolytics and hypnotics given with baclofen or tizanidine

Nabulone: increased sedative effect when anxiolytics and hypnotics given with nabulone

Nitrates: enhanced hypotensive effect when anxiolytics and hypnotics given with nitrates

Oestrogens: plasma concentration of melatonin increased by oestrogens

Probenecid: excretion of lorazepam reduced by probenecid (increased plasma concentration); excretion of nitrazepam possibly reduced by probenecid (increased plasma concentration)
Antibacterials: Sodium Oxybate: benzodiazepines enhance effects of sodium oxybate (avoid concomitant use).

Theophylline: effects of benzodiazepines possibly reduced by theophylline.

Ulcera-feeding Drugs: plasma concentration of melatonin increased by cimetidine; metabolism of benzodiazepines, clomethiazole and zaleplon inhibited by cimetidine (increased plasma concentration); metabolism of diazepam possibly inhibited by esomeprazole and omeprazole (increased plasma concentration).

Antioxidants and Antihypertensive: enhanced hypoten- sive effect when antioxidant and hypotensive given with hydralazine, minoxidil or sodium nitroprusside.

Arsenic Trioxide: see arsenic trioxide.

Oestrogens: increased risk of ventricular arrhythmias when arsenic trioxide given with haloperidol; avoid concomitant use of cytoxics with clozapine (increased risk of agranulocytosis).

Beta-blockers: increased risk of ventricular arrhythmias when arsenic trioxide given with aripiprazole.

Antidepressants: Apraclonidine, apomorphine.

Sodium Oxybate: benzodiazepines enhance effects of sodium oxybate (avoid concomitant use).

Anxiolytics and Hypnotics: BN Fenix Appendix 1: Interactions 819 increased risk of ventricular arrhythmias when arsenic trioxide given with antipsychotics that prolong the QT interval; increased risk of ventricular arrhythmias when arsenic trioxide given with haloperidol; avoid concomitant use of cytoxics with clozapine (increased risk of agranulocytosis).

Beta-blockers: increased risk of ventricular arrhythmias when arsenic trioxide given with aripiprazole.

Cardiac Glycosides: cytoxics reduce absorption of digoxin tablets.

Diuretics: risk of ventricular arrhythmias with arsenic trioxide increased by hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics.

Lithium: increased risk of ventricular arrhythmias when arsenic trioxide given with lithium.

Artemether with Luminetamine: Anti-arrrhythmic: manufacturer of artemether/lumefantrine advises avoid concomitant use with imatinib or disopyramide or ticlidine (risk of ventricular arrhythmias).

Antibacterial: manufacturer of artemether/lumefantrine advises avoid concomitant use with macrolides and quinolones.

Antifungal: manufacturer of artemether/lumefantrine advises avoid concomitant use with antipsychotics.

Antimalarial: manufacturer of artemether/lumefantrine advises avoid concomitant use with antipsychotics.

Antihypertensive: manufacturer of artemether/lumefantrine advises avoid concomitant use with antipsychotics.

Antiviral: manufacturer of artemether/lumefantrine advises caution with atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir and tipranavir.

Beta-blocker: manufacturer of artemether/lumefantrine advises avoid concomitant use with metoprolol and esmolol.

Grapefruit Juice: plasma concentration of artemether/lumefantrine possibly increased by grapefruit juice.

Antimicrobial: manufacturer of artemether/lumefantrine advises caution with atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir and tipranavir.

Anticoagulant: manufacturer of artemether/lumefantrine advises caution with atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir and tipranavir.

Antihypertensive: manufacturer of artemether/lumefantrine advises avoid concomitant use with imatinib or disopyramide or Ticlidine (risk of ventricular arrhythmias).

Antibacterial: manufacturer of artemether/lumefantrine advises avoid concomitant use with macrolides and quinolones.

Antimalarial: manufacturer of artemether/lumefantrine advises avoid concomitant use with antipsychotics.

Antiviral: manufacturer of artemether/lumefantrine advises caution with atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir and tipranavir.

Beta-blocker: manufacturer of artemether/lumefantrine advises avoid concomitant use with metoprolol and esmolol.

Grapefruit Juice: plasma concentration of artemether/lumefantrine possibly increased by grapefruit juice.

Antimicrobial: manufacturer of artemether/lumefantrine advises caution with atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir and tipranavir.

Anticoagulant: manufacturer of artemether/lumefantrine advises caution with atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir and tipranavir.

Antibacterial: manufacturer of artemether/lumefantrine advises avoid concomitant use with macrolides and quinolones.

Antimalarial: manufacturer of artemether/lumefantrine advises avoid concomitant use with antipsychotics.

Antiviral: manufacturer of artemether/lumefantrine advises caution with atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir and tipranavir.

Beta-blocker: manufacturer of artemether/lumefantrine advises avoid concomitant use with metoprolol and esmolol.

Grapefruit Juice: plasma concentration of artemether/lumefantrine possibly increased by grapefruit juice.

Antimicrobial: manufacturer of artemether/lumefantrine advises caution with atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir and tipranavir.

Anticoagulant: manufacturer of artemether/lumefantrine advises caution with atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir and tipranavir.

Antibacterial: manufacturer of artemether/lumefantrine advises avoid concomitant use with macrolides and quinolones.

Antimalarial: manufacturer of artemether/lumefantrine advises avoid concomitant use with antipsychotics.

Antiviral: manufacturer of artemether/lumefantrine advises caution with atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir and tipranavir.

Beta-blocker: manufacturer of artemether/lumefantrine advises avoid concomitant use with metoprolol and esmolol.

Grapefruit Juice: plasma concentration of artemether/lumefantrine possibly increased by grapefruit juice.

Antimicrobial: manufacturer of artemether/lumefantrine advises caution with atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir and tipranavir.

Anticoagulant: manufacturer of artemether/lumefantrine advises caution with atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir and tipranavir.

Antibacterial: manufacturer of artemether/lumefantrine advises avoid concomitant use with macrolides and quinolones.

Antimalarial: manufacturer of artemether/lumefantrine advises avoid concomitant use with antipsychotics.

Antiviral: manufacturer of artemether/lumefantrine advises caution with atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir and tipranavir.

Beta-blocker: manufacturer of artemether/lumefantrine advises avoid concomitant use with metoprolol and esmolol.

Grapefruit Juice: plasma concentration of artemether/lumefantrine possibly increased by grapefruit juice.

Antimicrobial: manufacturer of artemether/lumefantrine advises caution with atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir and tipranavir.

Anticoagulant: manufacturer of artemether/lumefantrine advises caution with atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir and tipranavir.

Antibacterial: manufacturer of artemether/lumefantrine advises avoid concomitant use with macrolides and quinolones.

Antimalarial: manufacturer of artemether/lumefantrine advises avoid concomitant use with antipsychotics.

Antiviral: manufacturer of artemether/lumefantrine advises caution with atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir and tipranavir.

Beta-blocker: manufacturer of artemether/lumefantrine advises avoid concomitant use with metoprolol and esmolol.

Grapefruit Juice: plasma concentration of artemether/lumefantrine possibly increased by grapefruit juice.

Antimicrobial: manufacturer of artemether/lumefantrine advises caution with atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir and tipranavir.

Anticoagulant: manufacturer of artemether/lumefantrine advises caution with atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir and tipranavir.
### Appendix 1: Interactions

**Aspirin (continued)**

- Antiepileptics: aspirin enhances effects of phenytoin and valproate
- Clopidogrel: increased risk of bleeding when aspirin given with clopidogrel
- Corticosteroids: increased risk of gastro-intestinal bleeding and ulceration when aspirin given with corticosteroids, also corticosteroids reduce plasma concentration of salicylate
- Cytotoxics: aspirin reduces excretion of methotrexate (increased risk of toxicity)—but for concomitant use in rheumatic disease see p. 647
- Diuretics: aspirin antagonises diuretic effect of spironolactone; increased risk of toxicity when high-dose aspirin given with carbonic anhydrase inhibitors
- Floxprost: increased risk of bleeding when aspirin given with floxprost
- Leukotriene Receptor Antagonists: aspirin increases plasma concentration of zafirlukast
- Metoclopramide: rate of absorption of aspirin increased by metoclopramide (enhanced effect)
- Prolonged: aspirin antagonises effects of probenecid
- Sulfinpyrazine: aspirin antagonises effects of sulfinpyrazine

**Atazanavir**

- Antacids: plasma concentration of atazanavir possibly reduced by antacids
- Anti-arrhythmics: atazanavir possibly increases plasma concentration of amiodarone and lidocaine
- Antibacterials: plasma concentration of both drugs increased when atazanavir given with clarithromycin; atazanavir increases plasma concentration of rifabutin (reduce dose of rifabutin); plasma concentration of atazanavir reduced by rifampicin
- Anti-Coagulants: atazanavir possibly increases plasma concentration of warfarin; avoidance of atazanavir advised by manufacturer of warfarin
- Antidepressants: plasma concentration of atazanavir reduced by St John's wort—avoid concomitant use
- Anti-Fungals: plasma concentration of atazanavir increased by posaconazole
- Antimalarials: caution with atazanavir advised by manufacturer of arteether/lumefantrine; atazanavir possibly increases plasma concentration of quinine (increased risk of toxicity)
- Antimuscarinics: avoidance of atazanavir advised by manufacturer of darifenacin; manufacturer of fesoterodine advises dose reduction when atazanavir given with fesoterodine—consult fesoterodine product literature
- Antipsychotics: atazanavir possibly inhibits metabolism of aripiprazole; atazanavir possibly increases plasma concentration of pimozide—avoid concomitant use
- Antivirals: manufacturer of atazanavir advises avoid concomitant use with efavirenz (plasma concentration of atazanavir reduced); avoid concomitant use of atazanavir with indinavir; atazanavir increases plasma concentration of maraviroc (consider reducing dose of maraviroc); plasma concentration of atazanavir possibly reduced by nevirapine—avoid concomitant use; increased risk of ventricular arrhythmias when atazanavir given with saquinavir—avoid concomitant use; plasma concentration of atazanavir reduced by tenofovir, also plasma concentration of tenofovir possibly increased; atazanavir increases plasma concentration of tipranavir (also plasma concentration of atazanavir reduced)
- Anxiolytics and Hypnotics: atazanavir possibly increases plasma concentration of midazolam—avoid concomitant use of oral midazolam
- Calcium-channel Blockers: atazanavir increases plasma concentration of nitrendipine (reduce dose of nitrendipine)
- CYP3A4/isoform inhibitors: atazanavir possibly increases plasma concentration of efavirenz; atazanavir possibly increases plasma concentration of ritonavir
- CYP3A4/isoform inducers: atazanavir possibly increases plasma concentration of midazolam, possibly increased risk of toxicity when given with rifampicin
- Ergot Alkaloids: atazanavir possibly increases plasma concentration of ergot alkaloids—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when atazanavir given with atorvastatin; possible increased risk of myopathy when atazanavir given with rosuvastatin—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when atazanavir given with simvastatin (avoid concomitant use)
- Oestrogens: atazanavir increases plasma concentration of ethinylestradiol
- Ranolazine: atazanavir possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: atazanavir possibly increases plasma concentration of sildenafil
- Siroliimus: atazanavir possibly increases plasma concentration of sirolimus
- Tacrolimus: atazanavir possibly increases plasma concentration of tacrolimus
- Urea-removal Drugs: plasma concentration of atazanavir reduced by lamotrigine

**Atenolol** see Beta-blockers

**Atorvastatin**

- Analgesics: increased risk of ventricular arrhythmias when atorvastatin given with tramadol
- Anti-arrhythmics: increased risk of ventricular arrhythmias when atorvastatin given with tramadol
- Anti-inflammatory Drugs: increased risk of convulsions when atorvastatin given with tramadol
- Anti-platelets: increased risk of convulsions when atorvastatin given with tramadol
- Antipsychotics: increased risk of ventricular arrhythmias when atorvastatin given with tramadol

**Bupropion** see Antidepressants

**Calcium-channel Blockers (continued)**

- Calcium-channel Blockers: atazanavir possibly increases plasma concentration of verapamil
- Ciclosporin: atazanavir possibly increases plasma concentration of ciclosporin
- Colchicine: atazanavir possibly increases risk of colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Cytotoxics: atazanavir possibly increases plasma concentration of metronomil—manufacturer of metronomil advises avoid concomitant use; avoidance of atazanavir advised by manufacturer of paclitaxel; atazanavir possibly inhibits metabolism of etinotecan (increased risk of toxicity)
- Ergot Alkaloids: atazanavir possibly increases plasma concentration of ergot alkaloids—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when atazanavir given with atorvastatin; possible increased risk of myopathy when atazanavir given with rosuvastatin—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when atazanavir given with simvastatin (avoid concomitant use)
- Oestrogens: atazanavir increases plasma concentration of ethinylestradiol
- Ranolazine: atazanavir possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: atazanavir possibly increases plasma concentration of sildenafil
- Siroliimus: atazanavir possibly increases plasma concentration of sirolimus
- Tacrolimus: atazanavir possibly increases plasma concentration of tacrolimus
- Urea-removal Drugs: plasma concentration of atazanavir reduced by lamotrigine

**Clopidogrel** see Antiaplotics

**Corticosteroids**

- Anti-inflammatory Drugs: increased risk of convulsions when atorvastatin given with tramadol
- Anti-platelets: increased risk of convulsions when atorvastatin given with tramadol
- Antipsychotics: increased risk of ventricular arrhythmias when atorvastatin given with tramadol

**Diuretics** see Antidiuretics

**Diuretics**

- Anti-inflammatory Drugs: increased risk of ventricular arrhythmias when atorvastatin given with tramadol
- Anti-platelets: increased risk of convulsions when atorvastatin given with tramadol
- Antipsychotics: increased risk of ventricular arrhythmias when atorvastatin given with tramadol

**Diltiazem** see Calcium-channel Blockers

**Efavirenz** see Antivirals

**Ergot Alkaloids**

- Anti-arrhythmics: increased risk of ventricular arrhythmias when atorvastatin given with tramadol
- Anti-inflammatory Drugs: increased risk of convulsions when atorvastatin given with tramadol
- Anti-platelets: increased risk of convulsions when atorvastatin given with tramadol
- Antipsychotics: increased risk of ventricular arrhythmias when atorvastatin given with tramadol

**Erythromycin** see Antibacterials

**F_EDR** see Antiepileptics

**Furosemide** see Diuretics

**HMG-CoA Reductase Inhibitors**

- Anti-arrhythmics: increased risk of ventricular arrhythmias when atorvastatin given with tramadol
- Anti-inflammatory Drugs: increased risk of convulsions when atorvastatin given with tramadol
- Anti-platelets: increased risk of convulsions when atorvastatin given with tramadol
- Antipsychotics: increased risk of ventricular arrhythmias when atorvastatin given with tramadol

**Hydralazine** see Calcium-channel Blockers

**Lidocaine** see Anti-arrhythmics

**Midazolam** see Anxiety

**Nitrendipine** see Calcium-channel Blockers

**Paracetamol** see Analgesics

**Pentazocine** see Antipsychotics

**Phenytoin** see Antiepileptics

**Protein Kinase C Inhibitors**

- Anti-arrhythmics: increased risk of ventricular arrhythmias when atorvastatin given with tramadol
- Anti-inflammatory Drugs: increased risk of convulsions when atorvastatin given with tramadol
- Anti-platelets: increased risk of convulsions when atorvastatin given with tramadol
- Antipsychotics: increased risk of ventricular arrhythmias when atorvastatin given with tramadol

**Rosuvastatin** see Lipid-regulating Drugs

**Sildenafil** see Calcium-channel Blockers

**Simvastatin** see Lipid-regulating Drugs

**Spironolactone** see Antihypertensives

**St John's Wort** see Antidiuretics

**Tacrolimus** see Antimalarials

**Valproate** see Antiepileptics

**Zafirlukast** see Antileukotrienes

**Zidovudine** see Antiretrovirals

---

**Appendix 2: Antidepressants**

- Analgesics: increased risk of ventricular arrhythmias when atorvastatin given with methadone; possible increased risk of convulsions when atorvastatin given with tramadol
- Anti-arrhythmics: increased risk of ventricular arrhythmias when atorvastatin given with tramadol
- Anti-inflammatory Drugs: increased risk of convulsions when atorvastatin given with tramadol
- Anti-platelets: increased risk of convulsions when atorvastatin given with tramadol
- Antipsychotics: increased risk of ventricular arrhythmias when atorvastatin given with tramadol

**Appendix 3: Antihypertensives**

- Analgesics: increased risk of ventricular arrhythmias when atorvastatin given with methadone; possible increased risk of convulsions when atorvastatin given with tramadol
- Anti-arrhythmics: increased risk of ventricular arrhythmias when atorvastatin given with tramadol
- Anti-inflammatory Drugs: increased risk of convulsions when atorvastatin given with tramadol
- Anti-platelets: increased risk of convulsions when atorvastatin given with tramadol
- Antipsychotics: increased risk of ventricular arrhythmias when atorvastatin given with tramadol
Barbiturates

- Antidepressants (continued)
- Antiepileptics: phenobarbital reduces plasma concentration of carbamazepine, lamotrigine, tiagabine and zonisamide; phenobarbital possibly reduces plasma concentration of ethosuximide; plasma concentration of phenobarbital increased by oxcabazepine, also plasma concentration of an active metabolite of oxcabazepine reduced; plasma concentration of phenobarbital often increased by phenytoin, plasma concentration of phenytoin often reduced but may be increased; increased sedative effect when barbiturates given with primidone; phenobarbital possibly reduces plasma concentration of rufinamide, also plasma concentration of phenobarbital possibly increased; plasma concentration of phenobarbital possibly reduced; plasma concentration of phenobarbital reduced especially in renal impairment; increased risk of anaemia or leucopenia when azathioprine given with enalapril especially in renal impairment; increased risk of anaemia when azathioprine given with enalapril especially in renal impairment; increased risk of haematological toxicity when azathioprine given with trimethoprim (also with co-trimoxazole)
- Anticoagulants: phenobarbital possibly reduces plasma concentration of rufinamide; plasma concentration of both drugs reduced when phenobarbital given with chlorpromazine; phenobarbital possibly reduces plasma concentration of trimiprazole—increase dose of trimiprazole
- Antivirals: phenobarbital possibly reduces plasma concentration of abacavir, darunavir, fosamprenavir and lopinavir; avoidance of phenobarbital advised by manufacturer of etravirine; barbiturates possibly reduce plasma concentration of indinavir, nelfinavir and saquinavir; phenobarbital possibly reduces plasma concentration of indinavir, also plasma concentration of phenobarbital possibly increased
- Beta-blockers: barbiturates reduce plasma concentration of metoprolol and timolol; barbiturates possibly reduce plasma concentration of propranolol
- Calcium-channel Blockers: barbiturates reduce effects of elodipine and isradipine; barbiturates probably reduce effects of edihydropyridines, diltiazem and verapamil
- Ciclosporin: barbiturates accelerate metabolism of ciclosporin (reduced effect)
- Corticosteroids: barbiturates accelerate metabolism of corticosteroids (reduced effect)
- Cytotoxics: avoidance of barbiturates advised by manufacturer of gefitinib; phenobarbital possibly reduces plasma concentration of etoposide; phenobarbital reduces plasma concentration of irinotecan and its active metabolite
- Diuretics: phenobarbital reduces plasma concentration of spironolactone—avoid concomitant use; increased risk of osteomalacia when phenobarbital given with carbonic anhydrase inhibitors
- Folates: plasma concentration of phenobarbital possibly reduced by folates

Hormone Antagonists: barbiturates possibly accelerate metabolism of toremifene (reduced plasma concentration)
## Appendix 1: Interactions

### Barbiturates (continued)

Leukotriene Receptor Antagonists: phenobarbital reduces plasma concentration of montelukast

Lofexidine: increased sedative effect when barbiturates given with lofexidine

Methotrexate: effects of barbiturates possibly reduced by memantine

● Oestrogens: barbiturates accelerate metabolism of oestrogens (reduced contraceptive effect—see p. 495)

● Progestogens: barbiturates accelerate metabolism of progestogens (reduced contraceptive effect—see p. 495)

● Sodium Oxybate: barbiturates enhance effects of sodium oxybate (avoid concomitant use)

Sympathomimetics: plasma concentration of phenobarbital possibly increased by methylphenidate

Ticarcillin: phenobarbital reduces plasma concentration of ticarcillin

Theophylline: barbiturates accelerate metabolism of theophylline (reduced plasma concentration)

Thyroid Hormones: barbiturates accelerate metabolism of thyroid hormones (may increase requirements for thyroid hormones in hypothyroidism)

Tibolone: barbiturates accelerate metabolism of tibolone (reduced plasma concentration)

● Ulipristal: avoidance of phenobarbital advised by manufacturer of ulipristal (contraceptive effect of ulipristal possibly reduced)

Vitamins: barbiturates possibly increase requirements for vitamin D

**Beclometasone** see Corticosteroids

**Bemiparin** see Heparins

**Bendamustine**

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

● Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)

Cardiac Glysides: cytotoxics reduce absorption of digoxin tablets

**Bendroflumethiazide** see Diuretics

**Benperidol** see Antipsychotics

**Benzodiazepines** see Antiepileptics and Hypnotics

**Benztropine** see Diuretics

**Benzylenecillin** see Penicillins

### Beta-blockers

#### Note

Since systemic absorption may follow topical application, be cautious of beta-blockers to the eye the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind

**ACE Inhibitors**: enhanced hypotensive effect when beta-blockers given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when beta-blockers given with adrenergic neurone blockers

Alcohol: enhanced hypotensive effect when beta-blockers given with alcohol

Aldesleukin: enhanced hypotensive effect when beta-blockers given with aldesleukin

● Alpha-blockers: enhanced hypotensive effect when beta-blockers given with alpha-blockers, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin

Anaesthetics, General: enhanced hypotensive effect when beta-blockers given with general anaesthetics

Anaesthetics, Local: pranoprolol increases risk of bupivacaine toxicity

Analgesics: hypotensive effect of beta-blockers antagonised by NSAIDs; plasma concentration of esmolol possibly increased by morphine

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when beta-blockers given with angiotensin-II receptor antagonists

Anti-arrhythmics: increased myocardial depression when beta-blockers given with anti-arrhythmics; increased risk of bradycardia, AV block and myocardial depression when beta-blockers given with amiodarone; increased risk of ventricular arrhythmias when sotalol given with metoprolol and propranolol increased by propafenone

Antibacterials: increased risk of ventricular arrhythmias when sotalol given with minocycline—avoid concomitant use; metabolism of biperiden and propranolol accelerated by rifampicin (plasma concentration significantly reduced); plasma concentration of carvedilol, celtrolol and metoprolol reduced by rifampicin

Antidepressants: plasma concentration of metoprolol increased by citalopram and escitalopram; plasma concentration of propranolol increased by fluvoxamine; plasma concentration of metoprolol possibly increased by paroxetine (enhanced effect); labetalol and propranolol increase plasma concentration of imipramine; enhanced hypotensive effect when beta-blockers given with MAOIs; increased risk of ventricular arrhythmias when sotalol given with tricyclics

Antidiabetics: beta-blockers may mask warning signs of hypoglycaemia (such as tremor) with anti-diabetics; beta-blockers enhance hypoglycaemic effect of insulin

Antihistamines: increased risk of ventricular arrhythmias when sotalol given with mizolastine—avoid concomitant use

Antimalarials: avoidance of metoprolol and sotalol advised by manufacturer of artepemether/lumefantrine; increased risk of bradycardia when beta-blockers given with metofloquine

Antimuscarnics: increased risk of ventricular arrhythmias when sotalol given with galantamine

Antipsychotics: increased risk of ventricular arrhythmias when sotalol given with clozapine, chlorpromazine, amisulpride, phenothiazines, eipimozide or sulpiride; enhanced hypotensive effect when beta-blockers given with phenothiazines

Antivirals: increased risk of ventricular arrhythmias when sotalol given with saquinavir—avoid concomitant use; avoidance of metoprolol for heart failure advised by manufacturer of tipranavir

Anti-arrhythmics: increased risk of ventricular arrhythmias when sotalol given with atomoxetine

Barbiturates: plasma concentration of metoprolol and timolol reduced by barbiturates; plasma concentration of propranolol possibly reduced by barbiturates

Calcium-channel Blockers: enhanced hypotensive effect when beta-blockers given with calcium-channel blockers; possible severe hypotension and heart failure when beta-blockers given with nifedipine; increased risk of AV block and bradycardia when beta-blockers given with diltiazem; astyole, severe hypotension and heart failure when beta-blockers given with verapamil (see p. 133)

Cardiac Glycosides: increased risk of AV block and bradycardia when beta-blockers given with cardiac glycosides
Betablockers (continued)

- Ciclosporin: carvedilol increases plasma concentration of ciclosporin
- Clonidine: increased risk of withdrawal hypertension when beta-blockers given with clonidine (withdraw beta-blockers several days before slowly withdrawing clonidine)

Corticosteroids: hypertensive effect of beta-blockers antagonised by corticosteroids

- Cytotoxics: increased risk of ventricular arrhythmias when sotalol given with arsenic trioxide
- Diazoxide: enhanced hypertensive effect when beta-blockers given with diazoxide

Diuretics: enhanced hypertensive effect when beta-blockers given with diuretics; risk of ventricular arrhythmias with sotalol increased by hypokaemia caused by loop diuretics or thiazides and related diuretics
- Dopaminergics: enhanced hypertensive effect when beta-blockers given with levodopa

Ergot Alkaloids: increased peripheral vasoconstriction when beta-blockers given with ergotamine and methysergide

- SHT, Agonists: propranolol increases plasma concentration of ziratintrapeut (manufacturer of ziratritape advises half dose and avoid within 2 hours of propranolol)
- Ibabradine: increased risk of ventricular arrhythmias when sotalol given with ibabradine

Methylprednisolone: enhanced hypertensive effect when beta-blockers given with methyldopa
- Moxisylyte: possible severe postural hypotension when beta-blockers given with moxisylyte
- Moxonidine: enhanced hypertensive effect when beta-blockers given with moxonidine

Muscle Relaxants: propranolol enhances effects of muscle relaxants; enhanced hypertensive effect when beta-blockers given with baclofen; possible enhanced hypertensive effect and bradycardia when beta-blockers given with tizanidine

Nitrates: enhanced hypertensive effect when beta-blockers given with nitrates
- Oestrogens: hypertensive effect of beta-blockers antagonised by oestrogens

Parasympathomimetics: propranolol antagonises effects of neostigmine and pyridostigmine; increased risk of arrhythmias when beta-blockers given with pilocarpine

Prostaglandins: enhanced hypertensive effect when beta-blockers given with alprostadil
- Ranolazine: avoidance of sotalol advised by manufacturer of ranolazine

Sympathomimeticones: increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with adrenaline (epinephrine), also reponse to adrenaline (epinephrine) may be reduced; increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with dobutamine: possible increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers given with noradrenaline (norepinephrine)

Thyroid Hormones: metabolism of propranolol accelerated by levothyroxine

- Ulcer-healing Drugs: plasma concentration of labetalol, metoprolol and propranolol increased by cimetidine

- Vasodilator Antihypertensives: enhanced hypertensive effect when beta-blockers given with hydralazine, minoxidil or sodium nitroprusside
- Betahistine: Antihistamines: effect of betahistine theoretically antagonised by antihistamines
- Betamethasone see Corticosteroids
- Betaxolol see Beta-blockers
- Bethanechol see Parasympathomimetics

Bexarotene
- Antiepileptics: cytoprotection possibly reduce absorption of phenytoin
- Antipsyhtics: avoid concomitant use of cytotoxics with doxorubicine (increased risk of agranulocytosis)
- Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Lipid-regulating Drugs: plasma concentration of bexarotene increased by simvastatin—avoid concomitant use

Bezafibrate see Fibrates

Bicalutamide
- Anti-coagulants: bicalutamide possibly enhances anticoagulant effect of coumarins

Bigeunides see Antidiabetics

Bile Acid Sequestrants see Colesevelam, Colestipol, and Colestyramine

Bile Acids see Ursodeoxycholic Acid

Bisoprolol see Beta-blockers

Bisphosphonates
- Analgesics: bioavailability of thulordic acid increased by indomethacin
- Antacids: absorption of bisphosphonates reduced by antacids
- Antibacterials: increased risk of hypokaemia when bisphosphonates given with aminoglycosides
- Calcium Salts: absorption of bisphosphonates reduced by calcium salts
- Cytotoxics: sodium clodronate increases plasma concentration of etrastamustine
- Iron: absorption of bisphosphonates reduced by oral iron

Bleomycin
- Antiepileptics: cytoprotection possibly reduce absorption of phenytoin
- Antipsyhtics: avoid concomitant use of cytotoxics with doxorubicine (increased risk of agranulocytosis)
- Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Bortezomib
- Antiepileptics: cytoprotection possibly reduce absorption of phenytoin
- Antifungals: plasma concentration of bortezomib increased by ketoconazole
- Antipsyhtics: avoid concomitant use of cytotoxics with doxorubicine (increased risk of agranulocytosis)
- Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Bosantan
- Antibacterials: plasma concentration of bosantan increased by rifampicin—avoid concomitant use
- Anticoagulants: manufacturer of bosantan recommends monitoring anticoagulant effect of coumarins
- Antidiabetics: increased risk of hepatotoxicity when bosantan given with glibenclamide—avoid concomitant use
- Antifungals: plasma concentration of bosantan increased by ketoconazole; plasma concentration of bosantan possibly increased by itraconazole—avoid concomitant use; plasma concentration of bosantan possibly increased by itraconazole
- Antivirals: plasma concentration of bosantan possibly increased by ritonavir
- Ciclosporin: plasma concentration of bosantan increased by ciclosporin (also plasma concentration of ciclosporin reduced—avoid concomitant use)
- Lipid-regulating Drugs: bosantan reduces plasma concentration of simvastatin
- Oestrogens: bosantan possibly causes contraceptive failure of hormonal contraceptives containing
- Oestrogens (alternative contraception recommended)
- Progestogens: bosantan possibly causes contraceptive failure of hormonal contraceptives containing
- Progestogens (alternative contraception recommended)
Antidepressants: manufacturer of bupropion advises avoid concomitant use with MAOIs, tricyclic-related antidepressants and tricyclics

Bupropion

Antipsychotics: plasma concentration of cabergoline increased by erythromycin (increased risk of toxicity); plasma concentration of cabergoline possibly increased by macrolides (increased risk of toxicity)

Antipsychotics: increased risk of hepatotoxicity when busulfan given with tioguanine

Butorphanol see Barbiturates

Butyrophenones see Antipsychotics

Cabe
geline

Antibacterials: plasma concentration of cabergoline increased by erythromycin (increased risk of toxicity); plasma concentration of cabergoline possibly increased by macrolides (increased risk of toxicity)

Antipsychotics: increased risk of hepatotoxicity when busulfan given with tioguanine

Corticotosteroids: absorption of calcium salts reduced by corticosteroids

Diuretics: increased risk of hypercalcaemia when calcium salts given with thiazides and related diuretics

Calcium channel Blockers

ACE Inhibitors: enhanced hypotensive effect when calcium-channel blockers given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when calcium-channel blockers given with adrenergic neurone blockers

Alcohol: enhanced hypotensive effect when calcium-channel blockers given with alcohol; verapamil possibly increases plasma concentration of alcohol

Aldesleukin: enhanced hypotensive effect when calcium-channel blockers given with aldesleukin

Alpha-blockers: enhanced hypotensive effect when calcium-channel blockers given with α-blockers, also increased risk of first-dose hypotension with post-synaptic α-blockers such as prazosin

Anaesthetics, General: enhanced hypotensive effect when calcium-channel blockers given with general anaesthetics or isoflurane; hypotensive effect of verapamil enhanced by general anaesthetics (also AV delay)

Antagonists: hypotensive effect of calcium-channel blockers antagonised by NSAIDs; diltiazem inhibits metabolism of alfentanil (risk of prolonged or delayed respiratory depression)

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when calcium-channel blockers given with angiotensin-II receptor antagonists

Anti-arrhythmics: increased risk of bradycardia, AV block and myocardial depression when diltiazem or
Calcium-channel Blockers (continued)

- Verapamil given with lercanidipine; increased risk of myocardial depression and asystole when verapamil given with disopyramide or dronedarone; nifedipine increases plasma concentration of dronedarone.

- Antiarrhythmics: metabolism of verapamil possibly inhibited by amiodarone and verapamil reduces metabolism of nifedipine possibly inhibited by amiodarone; increased risk of bradyarrhythmias and myocardial depression when diltiazem and verapamil given with theophylline; nifedipine increases plasma concentration of theophylline.

- Antibacterials: metabolism of verapamil possibly inhibited by erythromycin and increased risk of toxicity; metabolism of felodipine possibly inhibited by erythromycin; increased plasma concentration of nifedipine; metabolism of diltiazem, nifedipine, and nimodipine accelerated by ifenprodil; plasma concentration significantly increased; metabolism of amlodipine and nifedipine possibly accelerated by ifenprodil (possible significantly reduced plasma concentration).

- Anticoagulants: verapamil possibly increases plasma concentration of dabigatran etexilate (reduce dose of dabigatran etexilate).

- Antidepressants: metabolism of nifedipine possibly inhibited by fluoxetine (increased plasma concentration); diltiazem and verapamil increase plasma concentration of imipramine; enhanced hypotensive effect when calcium-channel blockers given with MAOIs; plasma concentration of verapamil significantly reduced by St John’s wort; plasma concentration of nifedipine reduced by St John’s wort; plasma concentration of amlodipine possibly reduced by St John’s wort; diltiazem and verapamil possibly increase plasma concentration of tricyclic antidepressants: glucose tolerance occasionally impaired when nifedipine given with insulin.

- Anti-epileptics: effects of dihydropyridines, nifedipine, and nifedipine probably reduced by carbamazepine; diltiazem and verapamil enhance effects of carbamazepine; effects of felodipine and isradipine reduced by carbamazepine; effects of felodipine, isradipine, and verapamil reduced by phenytoin; effects of dihydropyridines, nifedipine, and nifedipine probably reduced by phenytoin; diltiazem increases plasma concentration of phenytoin, also increased risk of bradycardia; nifedipine reduces the effect of phenytoin but also affects diltiazem reduced; effects of felodipine and isradipine reduced by primidone; effects of dihydropyridines, diltiazem, and verapamil probably reduced by phenytoin; effects of dihydropyridines, diltiazem, and verapamil probably reduced by phenytoin.

- Antiinflammaty: metabolism of dihydropyridines possibly inhibited by tacrolimus and cyclosporine (increased plasma concentration); metabolism of felodipine inhibited by tacrolimus and cyclosporine; increased plasma concentration of ciclosporin increased by tacrolimus; effects of ciclosporin possibly inhibited by cyclosporine (increased plasma concentration of ciclosporin); effects of ciclosporin possibly inhibited by cyclosporine (increased plasma concentration of ciclosporin); combination of ciclosporin with ciclosporin may increase plasma concentration of eplerenone (reduce dose of eplerenone).

- Cytostatics: plasma concentration of both drugs may increase when verapamil given with atovaquone; nifedipine possibly inhibits metabolism of vincristine and actinomycin D; diazoxide; enhanced hypotensive effect when calcium-channel blockers given with diazoxide.

- Diazoxide: enhanced hypotensive effect when calcium-channel blockers given with diazoxide; plasma concentration of amlodipine possibly increased by grapefruit juice.

- Dopaminergics: enhanced hypotensive effect when calcium-channel blockers given with levodopa; heparin.

- Antithrombotics: plasma concentration of diltiazem increased by warfarin; plasma concentration of verapamil increased by atazanavir; plasma concentration of diltiazem reduced by efavirenz; plasma concentration of calcium-channel blockers possibly increased by atazanavir; manufacturer of lercanidipine advises avoid concomitant use with atazanavir.

- Antivirals: plasma concentration of diltiazem increased by atazanavir (reduce dose of diltiazem); plasma concentration of verapamil possibly increased by atazanavir; plasma concentration of diltiazem reduced by efavirenz; plasma concentration of calcium-channel blockers possibly increased by atazanavir; manufacturer of lercanidipine advises avoid concomitant use with atazanavir.

- Antipsychotics: enhanced hypotensive effect when calcium-channel blockers given with antipsychotics.

- Barbiturates: effects of dihydropyridines, diltiazem, and verapamil possibly reduced by barbiturates; effects of felodipine and isradipine reduced by barbiturates.

- Beta-blockers: enhanced hypotensive effect when calcium-channel blockers given with beta-blockers; increased risk of AV block and bradycardia; nifedipine possibly increases plasma concentration of atorvastatin (reduce dose of atorvastatin).

- Cilostazol: diltiazem increases plasma concentration of cilostazol (consider reducing dose of cilostazol).

- Clonidine: effects of diltiazem and verapamil possibly increased by clonidine.

- Corticosteroids: enhanced hypotensive effect when calcium-channel blockers given with corticosteroids; diltiazem increases plasma concentration of methylprednisolone.

- Cytokines: plasma concentration of both drugs may increase when verapamil given with etanercept; nifedipine possibly inhibits metabolism of vincristine and actinomycin D; diazoxide; enhanced hypotensive effect when calcium-channel blockers given with diazoxide.

- Diazoxide: enhanced hypotensive effect when calcium-channel blockers given with diazoxide; plasma concentration of amlodipine possibly increased by grapefruit juice.

- Dopaminergics: enhanced hypotensive effect when calcium-channel blockers given with levodopa; heparin.

- Antithrombotics: plasma concentration of diltiazem increased by warfarin; plasma concentration of verapamil increased by atazanavir; plasma concentration of diltiazem reduced by efavirenz; plasma concentration of calcium-channel blockers possibly increased by atazanavir; manufacturer of lercanidipine advises avoid concomitant use with atazanavir.

- Antivirals: plasma concentration of diltiazem increased by atazanavir (reduce dose of diltiazem); plasma concentration of verapamil possibly increased by atazanavir; plasma concentration of diltiazem reduced by efavirenz; plasma concentration of calcium-channel blockers possibly increased by atazanavir; manufacturer of lercanidipine advises avoid concomitant use with atazanavir.
Lipid-regulating Drugs

Antiepileptics:

- Lipid-regulating Drugs (continued)
  - possible increased risk of myopathy when amlo-
    dipine given with simvastatin.
  - Lithium: neurotoxicity may occur when diltiazem or
    verapamil given with lithium without increased
    plasma concentration of lithium.
  - Magnesium (parenteral): profound hypotension
    reported with concomitant use of nifedipine and
    parenteral magnesium in pre-eclampsia.
  - Methylprednisolone: enhanced hypotensive effect when
    calcium-channel blockers given with methylpobra.
  - Moxisylyte: enhanced hypotensive effect when
    calcium-channel blockers given with moxisylyte.
  - Moxonidine: enhanced hypotensive effect when
    calcium-channel blockers given with moxonidine.

Muscle Relaxants: verapamil enhances effects of non-
depolarising muscle relaxants and suxamethonium; enhanced
hypotensive effect when calcium-channel blockers given with
baclofen or tizanidine; hypotension, myocardial depression, and
hyperkalaemia when verapamil given with intravenous dantrolene;
possible increased risk of ventricular arrhythmias when diltiazem
given with intravenous dantrolene—manufacturer of diltiazem advises avoid concomitant
use. calcium-channel blockers possibly enhance effects of non-
depolarising muscle relaxants.

Nitrates: enhanced hypotensive effect when calcium-
channel blockers given with nitrates.

Oestrogens: hypotensive effect of calcium-channel
blockers antagonised by oestrogens.

Prostaglandins: enhanced hypotensive effect when
 calcium-channel blockers given with alprostadil.

Ranolazine: diltiazem and verapamil increase plasma
concentration of ranolazine (consider reducing dose of
ranolazine).

Sildenafil: diltiazem and verapamil increase plasma
concentration of sildenafil (consider reducing dose of
diltiazem and verapamil).

Ulcer-healing Drugs: metabolism of calcium-channel
blockers possibly inhibited by cinemidine (increased
plasma concentration); plasma concentration of
isosapine increased by cinemidine (halve dose of
isosapine).

Vardenafil: enhanced hypotensive effect when nife-
dipine given with vardenafil.

Vasodilator Antihypertensives: enhanced hypoten-
sive effect when calcium-channel blockers given with
hydralazine, minoxidil or sodium nitroprusside.

Calcium-channel Blockers (dihydropyridines) see
Calcium-channel Blockers

Calcium-channel Blockers

- Lipid-regulating Drugs (continued)
  - possible increased risk of myopathy when amlo-
    dipine given with simvastatin.
  - Lithium: neurotoxicity may occur when diltiazem or
    verapamil given with lithium without increased
    plasma concentration of lithium.
  - Magnesium (parenteral): profound hypotension
    reported with concomitant use of nifedipine and
    parenteral magnesium in pre-eclampsia.
  - Methylprednisolone: enhanced hypotensive effect when
    calcium-channel blockers given with methylpobra.
  - Moxisylyte: enhanced hypotensive effect when
    calcium-channel blockers given with moxisylyte.
  - Moxonidine: enhanced hypotensive effect when
    calcium-channel blockers given with moxonidine.

Muscle Relaxants: verapamil enhances effects of non-
depolarising muscle relaxants and suxamethonium; enhanced
hypotensive effect when calcium-channel blockers given with
baclofen or tizanidine; hypotension, myocardial depression, and
hyperkalaemia when verapamil given with intravenous dantrolene;
possible increased risk of ventricular arrhythmias when diltiazem
given with intravenous dantrolene—manufacturer of diltiazem advises avoid concomitant
use. calcium-channel blockers possibly enhance effects of non-
depolarising muscle relaxants.

Nitrates: enhanced hypotensive effect when calcium-
channel blockers given with nitrates.

Oestrogens: hypotensive effect of calcium-channel
blockers antagonised by oestrogens.

Prostaglandins: enhanced hypotensive effect when
 calcium-channel blockers given with alprostadil.

Ranolazine: diltiazem and verapamil increase plasma
concentration of ranolazine (consider reducing dose of
ranolazine).

Sildenafil: diltiazem and verapamil increase plasma
concentration of sildenafil (consider reducing dose of
diltiazem and verapamil).

Ulcer-healing Drugs: metabolism of calcium-channel
blockers possibly inhibited by cinemidine (increased
plasma concentration); plasma concentration of
isosapine increased by cinemidine (halve dose of
isosapine).

Vardenafil: enhanced hypotensive effect when nife-
dipine given with vardenafil.

Vasodilator Antihypertensives: enhanced hypoten-
sive effect when calcium-channel blockers given with
hydralazine, minoxidil or sodium nitroprusside.

Calcium-channel Blockers (dihydropyridines) see
Calcium-channel Blockers

Candesartan see Angiotensins-II Receptor Antagonists

Cannabis Extract

Antidepressants: possible increased risk of hyper-
tension and tachycardia when cannabis extract given with
tricycls.

Captopril see Fluorouracil

Capreomycin (continued)

- Antibacterials: increased risk of nephrotoxicity when
  carbapenem given with colistin or polymyxins; in-
  creased risk of nephrotoxicity and ototoxicity when
  carbapenem given with aminoglycosides or vancocin-
  mycin.

Cytotoxics: increased risk of nephrotoxicity and
  ototoxicity when carbapenem given with platinum
  compounds.

Capreomycin

- Antibacterials: increased risk of nephrotoxicity when
  carbapenem given with colistin or polymyxins; in-
  creased risk of nephrotoxicity and ototoxicity when
  carbapenem given with aminoglycosides or vancocin-
  mycin.

Cytotoxics: increased risk of nephrotoxicity and
  ototoxicity when carbapenem given with platinum
  compounds.

Captopril see ACE Inhibitors

Carbamazepine

- Alcohol: CNS side-effects of carbamazepine possibly
  increased by alcohol.

- Analgesics: effects of carbamazepine enhanced by
dextropropoxyphene; carbamazepine reduces
  plasma concentration of methadone; carbamazepine
  reduces effects of tramadol; carbamazepine possibly
  accelerates metabolism of paracetamol.

- Antiarhythmics: carbamazepine possibly reduces
  plasma concentration of enonavirone—avoid con-
  comitant use.

- Antibacterials: plasma concentration of carbama-
  zepine increased by clotrimazole and
  erythromycin; plasma concentration of carba-
  mazepine reduced by rifabutin; carbamazepine
  accelerates metabolism of doxycline (reduced
  effect); plasma concentration of carbamazepine
  increased by azole (also possibly increased
  ionized hepatotoxicity); carbamazepine reduces
  plasma concentration of etilithromycin (avoid during
  and for 2 weeks after carbamazepine).

- Anticoagulants: carbamazepine accelerates metabolism of coumarins (reduced anticoagulant effect).

- Antidepressants: plasma concentration of carba-
  mazepine increased by fluoxetine and
  fluvoxamine; carbamazepine reduces plasma concentration
  of eminister and mirtazapine; manufacturer of carbamazepine advises avoid for 2 weeks
  after stopping MAOIs, also antagonism of anti-
  convulsant effect; anticonvulsant effect of anti-
  epileptics possibly antagonised by MAOIs and
  tricyclic-related antidepressants (convulsive
  threshold lowered); anticonvulsant effect of anti-
  epileptics antagonised by SSRIs and
  tricyclics (convulsive threshold lowered); avoid concomitant
  use of antiepileptics with St John’s wort; carba-
  mazepine accelerates metabolism of tricyclics
  (reduced plasma concentration and reduced effect).

- Antiplatelets: plasma concentration of both drugs
  reduced when carbamazepine given with eslicarba-
  zepine; carbamazepine possibly reduces plasma
  concentration of ethosuximide; carbamazepine often
  reduces plasma concentration of lamotrigine, also
  plasma concentration of an active metabolite of
  carbamazepine sometimes raised (but evidence is
  conflicting); possible increased risk of carba-
  mazepine toxicity when given with levetracetam; plasma
  concentration of carbamazepine sometimes reduced by
  oxcarbazepine (but concentration of an active
  metabolite of carbamazepine may be increased), also
  plasma concentration of an active metabolite of
  oxcarbazepine often reduced; plasma concentration of
  both drugs often reduced when carbamazepine
  given with phenytoin, also plasma concentration of
  phenytoin; also plasma concentration of phenytoin may be increased; plasma concentration
  of carbamazepine often reduced when given with
  rufinamide; plasma concentration of the active metabolite of
  carbamazepine sometimes reduced (but evidence is
  conflicting), also plasma concentration of an active
  metabolite of carbamazepine may be increased), also
  plasma concentration of an active metabolite of
  oxcarbazepine often reduced; plasma concentration of
  both drugs often reduced when carbamazepine
Carbamazepine

- Antifungals (continued): carbamazepine possibly reduces plasma concentration of caspofungin—consider increasing dose of caspofungin

- Antimalarials: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin reduced by rifampicin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antibacterials: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin reduced by rifampicin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antihistamines: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin reduced by rifampicin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Anti-inflammatory agents: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin reduced by rifampicin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Anticonvulsants: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin reduced by rifampicin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antidepressants: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin reduced by rifampicin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Anticoagulants: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin reduced by rifampicin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antidiabetics: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin reduced by rifampicin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antihypertensives: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin reduced by rifampicin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antimyotics: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antineoplastics: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antithrombotics: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antituberculosis agents: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antivirals: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antidepressants: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Anticoagulants: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antihypertensives: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antimyotics: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antineoplastics: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antituberculosis agents: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antivirals: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Anticoagulants: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antihypertensives: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antimyotics: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antineoplastics: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antituberculosis agents: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antivirals: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Anticoagulants: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antihypertensives: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antimyotics: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antineoplastics: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antituberculosis agents: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antivirals: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Anticoagulants: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antihypertensives: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antimyotics: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antineoplastics: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antituberculosis agents: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Antivirals: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)

- Anticoagulants: increased cardiac toxicity with cardiac glycosides possibly increased by gentamicin, telithromycin and trimethoprim; absorption of digoxin reduced by neomycin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity)}
Appendix 1: Interactions

Cardiac Glycosides (continued)

Caspofungin (continued)

Antivirals: plasma concentration of digoxin increased by etravirine; plasma concentration of digoxin possibly increased by ritonavir

Anticonvulsants and Hypnotics: plasma concentration of digoxin increased by alprazolam (increased risk of toxicity)

Beta-blockers: increased risk of AV block and bradycardia when cardiac glycosides given with beta-blockers

Calcium Salts: arrhythmias can be precipitated when cardiac glycosides given with large intravenous doses of calcium salts

- Calcium-channel blockers: plasma concentration of digoxin increased by edidazem, lercanidipine and nicardipine; plasma concentration of digoxin possibly increased by minoxidipine; plasma concentration of digoxin increased by verapamil, also increased risk of AV block and bradycardia

- Ciclosporin: plasma concentration of digoxin increased by ciclosporin (increased risk of toxicity)

- Colchicine: possible increased risk of myopathy when digoxin given with colchicine

- Corticosteroids: increased risk of hypokalaemia when cardiac glycosides given with corticosteroids

- Cytotoxic drugs: absorption of digoxin tablets reduced by cytoxic drugs

- Diuretics: increased cardiac toxicity with cardiac glycosides if hypokalaemia occurs with acetazolamide, loop diuretics or thiazides and related diuretics; plasma concentration of digoxin possibly increased by potassium canrenoate; plasma concentration of digoxin increased by epirronolactone

- Lenalidomide: plasma concentration of digoxin possibly increased by lenalidomide

- Lipid-regulating drugs: absorption of cardiac glycosides possibly reduced by colestipol and colestyramine; plasma concentration of digoxin possibly increased by atorvastatin

- Muscle relaxants: risk of ventricular arrhythmias when cardiac glycosides given with suxamethonium; possible increased risk of bradycardia when cardiac glycosides given with tizanidine

- Penicillamine: plasma concentration of digoxin possibly reduced by penicillamine

- Ranolazine: plasma concentration of digoxin increased by ranolazine

- Sympathomimetics, Beta-2: plasma concentration of digoxin possibly reduced by salbutamol

- Tolvaptan: plasma concentration of digoxin increased by tolvaptan (increased risk of toxicity)

- Uler-healing Drugs: plasma concentration of digoxin possibly slightly increased by proton pump inhibitors; absorption of cardiac glycosides possibly reduced by sucralfate

Carmustine

Antiepileptics: cytoxic possibly reduce absorption of phenytoin

Antipsychotics: avoid concomitant use of cytoxic with clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytoxic reduce absorption of digoxin tablets

Uler-healing Drugs: myelosuppressive effects of carmustine possibly enhanced by cimetidine

Ceftriaxone see Cefalosporins

Cefuroxime see Cefalosporins

Cefuroxime see Cefalosporins

Ceftaxime see Cefalosporins

Ceftobutane see Cefalosporins

Carbapenems see Beta-blockers

Ciclosporin

Antibacterials: plasma concentration of caspofungin initially increased and then reduced by rifampicin (consider increasing dose of caspofungin)

Antiepileptics: plasma concentration of caspofungin possibly reduced by carbamazepine and phenytoin—consider increasing dose of caspofungin

Antivirals: plasma concentration of caspofungin possibly reduced by efavirenz and nevirapine—consider increasing dose of caspofungin
Chloroquine and Hydroxychloroquine
Agalsidase Alfa and Beta (continued)
Antacid: absorption of chloroquine and hydroxychloroquine reduced by antacids
Anti-arrhythmics: increased risk of ventricular arrhythmias when chloroquine and hydroxychloroquine given with amiodarone—avoid concomitant use
Antibacterials: increased risk of nephrotoxicity when chloroquine given with trimethoprim, also plasma concentration of ciclosporin reduced by intravenous trimethoprim
Antidepressants: plasma concentration of ciclosporin reduced by St John’s wort—avoid concomitant use Antidiabetics: ciclosporin possibly enhances hypoglycaemic effect of repaglinide
Antiepileptics: metabolism of ciclosporin accelerated by carbamazepine and phenytoin (reduced plasma concentration); plasma concentration of ciclosporin possibly reduced by oxcarbazepine; metabolism of ciclosporin accelerated by pramidone (reduced effect)
Antifungals: metabolism of ciclosporin inhibited by fluconazole, itraconazole, ketoconazole, posaconazole and voriconazole (increased plasma concentration); metabolism of ciclosporin possibly inhibited by miconazole (increased plasma concentration); increased risk of nephrotoxicity when ciclosporin given with amphotericin; ciclosporin increases plasma concentration of eucapufin; (manufacturer of caspofungin recommends monitoring liver enzymes); plasma concentration of ciclosporin possibly reduced by guselkulin and terbinafine; plasma concentration of ciclosporin possibly increased by micafungin
Antimalarials: plasma concentration of ciclosporin increased by chloroquine and hydroxychloroquine (increased risk of toxicity)
Antimucosities: avoidance of ciclosporin advised by manufacturer of darifenacin
Antivirals: increased risk of nephrotoxicity when ciclosporin given with aciclovir; plasma concentration of ciclosporin possibly increased by etaxanavir, efavirenz and nelfinavir; plasma concentration of ciclosporin possibly reduced by efavirenz; plasma concentration of ciclosporin increased by fosamprenavir and indinavir; plasma concentration of both drugs increased when ciclosporin given with saquinavir
Barbiturates: metabolism of ciclosporin accelerated by barbiturates (reduced effect)
Beta-blockers: plasma concentration of ciclosporin increased by carvedilol
Bile Acids: absorption of ciclosporin increased by ursodeoxycholic acid
Bone:

Ciclosporin

Antibacterials: reduced plasma concentration of ciclosporin possibly increased by amiodarone and propafenone
Anti-arrhythmics: plasma concentration of ciclosporin possibly increased by amiodarone and propafenone
Antibacterials: metabolism of ciclosporin inhibited by clindamycin, doxycycline and etretinomycin (increased risk of nephrotoxicity when ciclosporin given with amiodarone or propafenone; metabolism of ciclosporin possibly increased by amiodarone and propafenone)
Antiepileptics: metabolism of ciclosporin inhibited by efavirenz; plasma concentration of ciclosporin possibly increased by etaxanavir, efavirenz and nelfinavir; plasma concentration of ciclosporin possibly reduced by efavirenz; plasma concentration of ciclosporin increased by fosamprenavir and indinavir; plasma concentration of both drugs increased when ciclosporin given with saquinavir
Antifungals: metabolism of ciclosporin inhibited by fluconazole, itraconazole, ketoconazole, posaconazole and voriconazole (increased plasma concentration); metabolism of ciclosporin possibly inhibited by miconazole (increased plasma concentration); increased risk of nephrotoxicity when ciclosporin given with amphotericin; ciclosporin increases plasma concentration of eucapufin; (manufacturer of caspofungin recommends monitoring liver enzymes); plasma concentration of ciclosporin possibly reduced by guselkulin and terbinafine; plasma concentration of ciclosporin possibly increased by micafungin
Antimalarials: plasma concentration of ciclosporin increased by chloroquine and hydroxychloroquine (increased risk of toxicity)
Antimucosities: avoidance of ciclosporin advised by manufacturer of darifenacin
Antivirals: increased risk of nephrotoxicity when ciclosporin given with aciclovir; plasma concentration of ciclosporin possibly increased by etaxanavir, efavirenz and nelfinavir; plasma concentration of ciclosporin possibly reduced by efavirenz; plasma concentration of ciclosporin increased by fosamprenavir and indinavir; plasma concentration of both drugs increased when ciclosporin given with saquinavir
Barbiturates: metabolism of ciclosporin accelerated by barbiturates (reduced effect)
Beta-blockers: plasma concentration of ciclosporin increased by carvedilol
Bile Acids: absorption of ciclosporin increased by ursodeoxycholic acid
Bone:...
Appendix 1: Interactions

**Cilazapril**
- Antivirals: increases plasma concentration of acyclovir and foscarnet

**Cidofovir**
- Antivirals: increases plasma concentration of cidofovir

**Tacrolimus**
- Calcium-channel Blockers: plasma concentration of ciclosporin increased by diltiazem (consider reducing dose of ciclosporin)

**Cimetidine**
- Histamine H2-antagonists

**Cinacalcet**
- Antifungals: metabolism of cinacalcet inhibited by ketoconazole (increased risk of nephrotoxicity and possibly hyperkalaemia when ciclosporin given with ketoconazole)
Clonidine (continued)
Calcium-channel Blockers: enhanced hypotensive effect when clonidine given with calcium-channel blockers
Corticosteroids: hypotensive effect of clonidine antagonised by corticosteroids
Diazoxide: enhanced hypotensive effect when clonidine given with diazoxide
Diuretics: enhanced hypotensive effect when clonidine given with diuretics
Dopaminergics: enhanced hypotensive effect when clonidine given with levodopa
Histamine: avoidance of clonidine advised by manufacturer of histamine
Methyldopa: enhanced hypotensive effect when clonidine given with methyldopa
Moxisylyte: enhanced hypotensive effect when clonidine given with moxisylyte
Moxonidine: enhanced hypotensive effect when clonidine given with moxonidine
Muscle Relaxants: enhanced hypotensive effect when clonidine given with baclofen or tizanidine
Nitrates: enhanced hypotensive effect when clonidine given with nitrates
Oestrogens: hypotensive effect of clonidine antagonised by oestrogens
Prostaglandins: enhanced hypotensive effect when clonidine given with alprostadil
Sympathomimetics: possible risk of hypertension when clonidine given with adrenaline (epinephrine) or noradrenaline (norepinephrine); serious adverse events reported with concomitant use of clonidine and methylphenidate (causality not established)
Vasodilator Antihypertensives: enhanced hypotensive effect when clonidine given with hydralazine, minoxidil or sodium nitroprusside
Clopamide see Diuretics
Clonidopril
Analgesics: increased risk of bleeding when clonidopril given with NSAIDs or aspirin
Antibacterials: antipatelet effect of clonidopril possibly reduced by ciprofloxacin and erythromycin
Anticoagulants: manufacturer of clonidopril advises avoidance concomitant use with warfarin; antipatelet action of clonidopril enhances anticoagulant effect of coumarins and phenindione; increased risk of bleeding when clonidopril given with heparins
Antidepressants: antipatelet effect of clonidopril possibly reduced by fluoxetine, fluvoxamine and moclobemide
Antiepileptics: antipatelet effect of clonidopril possibly reduced by carbamazepine and eslicarbazepine
Antifungals: antipatelet effect of clonidopril possibly reduced by raconazole, itraconazole, ketoconazole and voriconazole
Antivirals: antipatelet effect of clonidopril possibly reduced by estravirine
Dipyridamole: increased risk of bleeding when clonidopril given with dipyridamole
Iloprost: increased risk of bleeding when clonidopril given with iloprost
Prasugrel: possible increased risk of bleeding when clonidopril given with prasugrel
Ulcer-healing Drugs: antipatelet effect of clonidopril possibly reduced by omeprazole and rabeprazole; antipatelet effect of clonidopril reduced by esomeprazole and omeprazole
Clotrimazole see Antifungals, Imidazole
Clazapine see Antipsychotics
Clo-amoxiclav see Penicillins
Co-beneldopa see Levodopa
Co-careldopa see Levodopa
Codiene see Opioid Analgesics
Co-flumifucit see Penicillins

Appendix 1: Interactions

Co-flumipicil see Penicillins

Anticoagulants: possible increased risk of colchicine toxicity when given with amiodarone
Antibacterials: possible increased risk of colchicine toxicity when given with clarithromycin, erythromycin and telithromycin—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
Antifungals: possible increased risk of colchicine toxicity when given with itraconazole and ketoconazole—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
Antivirals: possible increased risk of colchicine toxicity when given with atazanavir, indinavir and efavirenz—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
Calcium-channel Blockers: possible increased risk of colchicine toxicity when given with dibetazem and verspani—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
Cardiac Glycosides: possible increased risk of myopathy when colchicine given with digoxin
Ciclosporin: possible increased risk of nephrotoxicity and myotoxicity when colchicine given with ciclosporin—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
Grapefruit Juice: possible increased risk of colchicine toxicity when given with grapefruit juice
Lipid-regulating Drugs: possible increased risk of myopathy when colchicine given with fibrates or statins
Colestevelam
Note Other drugs should be taken at least 4 hours before or after colestevelam to reduce possible interference with absorption
Antidiabetics: colestevelam reduces absorption of glibenclamide
Antiepileptics: colestevelam possibly reduces absorption of phenytoin
Ciclosporin: colestevelam reduces absorption of ciclosporin
Oestrogens: colestevelam reduces absorption of ethinylestradiol
Thyroid Hormones: colestevelam reduces absorption of levothyroxine
Colestipol
Note Other drugs should be taken at least 1 hour before or 4–6 hours after colestipol to reduce possible interference with absorption
Antibacterials: colestipol possibly reduces absorption of tetracycline
Bile Acids: colestipol possibly reduces absorption of bile acids
Cardiac Glycosides: colestipol possibly reduces absorption of cardiac glycosides
Diuretics: colestipol reduces absorption of thiazides and related diuretics (give at least 2 hours apart)
Thyroid Hormones: colestipol reduces absorption of thyroid hormones
Colestramine
Note Other drugs should be taken at least 1 hour before or 4–6 hours after colestramine to reduce possible interference with absorption
Analgesics: colestramine increases the excretion of meloxicam; colestramine reduces absorption of paracetamol
Antibacterials: colestramine possibly reduces absorption of tetracycline; colestramine antagonises effects of oral vancomycin
Anticoagulants: colestramine may enhance or reduce anticoagulant effect of coumarins and phenindione
Anticoagulants:

Antiepileptics:

Aldesleukin:

Corticosteroids

Antidiabetics:

Antibacterials:

Antifungals:

Corticosteroids (continued)
Vasodilator Antihypertensives: corticosteroids antagonise hypotensive effect of hydralazine, minoxidil and sodium nitroprusside

Cortisone see Corticosteroids

Co-trimoxazole see Trimethoprim and Sulfamethoxazole

Coumarins

Note: Change in patient’s clinical condition, particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may also affect anticoagulant control
• Alcohol: anticoagulant control with coumarins may be affected by major changes in consumption of alcohol
  Allopurinol: anticoagulant effect of coumarins possibly enhanced by allopurinol

• Anabolic Steroids: anticoagulant effect of coumarins enhanced by anabolic steroids

• Analgesics: anticoagulant effect of coumarins possibly enhanced by NSAIDs; increased risk of haemorrhage when anticoagulants given with intravenous diclofenac (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with ketorolac (avoid concomitant use, including low-dose heparins); anticoagulant effect of coumarins enhanced by tramadol; increased risk of bleeding when coumarins given with aspirin (due to antiplatelet effect); anticoagulant effect of coumarins possibly enhanced by prolonged regular use of paracetamol

• Anti-arrhythmics: metabolism of coumarins inhibited by amiodarone (enhanced anticoagulant effect); anticoagulant effect of coumarins enhanced by propafenone

• Antibacterials: experience in anticoagulant clinics suggests that INR possibly altered when coumarins are given with neomycin (given for local action on gut); anticoagulant effect of coumarins possibly enhanced by azithromycin, aztreonam, cephalexin, levofloxacin, erythromycin, tigecycline and trimethoprim; anticoagulant effect of coumarins enhanced by chloramphenicol, ciprofloxacin, clarithromycin, erythromycin, metronidazole, nalidixic acid, oxacillin, ofloxacin and sulphonamides; studies have failed to demonstrate an interaction with coumarins, but common experience in anticoagulant clinics is that INR can be altered by a course of broad-spectrum penicillins such as ampicillin; metabolism of coumarins accelerated by rifampicin (reduced anti-coagulant effect)

• Antidepressants: anticoagulant effect of warfarin possibly enhanced by venlafaxine; anticoagulant effect of warfarin may be enhanced or reduced by trazodone; anticoagulant effect of coumarins possibly enhanced by SSRIs; anticoagulant effect of coumarins reduced by St John’s wort (avoid concomitant use); anticoagulant effect of warfarin enhanced by mirtazapine; anticoagulant effect of coumarins may be enhanced or reduced by eticycloxycarbamine (reduced anti-coagulant effect)

• Anti-diabetics: anticoagulant effect of warfarin possibly enhanced by exenatide; coumarins possibly enhance hypoglycaemic effect of sulfonylureas, also possible changes to anticoagulant effect

• Antiepileptics: metabolism of coumarins accelerated by carbamazepine and primidon (reduced anti-coagulant effect); plasma concentration of warfarin reduced by eslicarbazepine; metabolism of coumarins accelerated by topiramate (possibility of reduced anticoagulant effect, but enhancement also reported); anticoagulant effect of coumarins possibly enhanced by valproate

• Antifungals: anticoagulant effect of coumarins enhanced by fluconazole, itraconazole

Appendix 1: Interactions

Co-trimoxazole and voriconazole; anticoagulant effect of coumarins enhanced by fluconazole (miconazole oral gel and possibly vaginal formulations absorbed); anticoagulant effect of coumarins reduced by griseofulvin

Antimalarials: isolated reports that anticoagulant effect of warfarin may be enhanced by proguanil; plasma concentration of both drugs increased when warfarin given with quinine

Antivirals: anticoagulant effect of warfarin may be enhanced or reduced by atazanavir, efavirenz and ritonavir; plasma concentration of warfarin possibly affected by efavirenz; anticoagulant effect of coumarins may be enhanced or reduced by fosamprenavir; anticoagulant effect of coumarins possibly enhanced by ritonavir; anticoagulant effect of warfarin possibly enhanced by saquinavir

Anxiolytics and Hypnotics: anticoagulant effect of coumarins may transiently be enhanced by chloral and triclofos

Aprepitant: anticoagulant effect of warfarin possibly reduced by aprepitant

Azathioprine: anticoagulant effect of coumarins possibly reduced by azathioprine

Barbiturates: metabolism of coumarins accelerated by barbiturates (reduced anticoagulant effect)

Bosentan: monitoring anticoagulant effect of coumarins recommended by manufacturer of bosentan

Clopidogrel: anticoagulant effect of coumarins enhanced due to antiplatelet action of clopidogrel; avoidance of warfarin advised by manufacturer of clopidogrel

Corticosteroids: anticoagulant effect of coumarins may be enhanced or reduced by corticosteroids (high-dose corticosteroids enhance anticoagulant effect)

Craberry Juice: anticoagulant effect of coumarins possibly enhanced by cranberry juice—avoid concomitant use

Cytotoxics: anticoagulant effect of coumarins possibly enhanced by etoposide, ifosfamide and mitomycin; anticoagulant effect of coumarins enhanced by fluorouracil; anticoagulant effect of warfarin possibly enhanced by efavirenz and gemcitabine; anticoagulant effect of coumarins possibly reduced by mercaptopurine and thioguanine; increased risk of bleeding when coumarins given with erlotinib; replacement of warfarin with a heparin advised by manufacturer of imatinib (possibility of enhanced warfarin effect)

Dipyridamole: anticoagulant effect of coumarins enhanced due to antiplatelet action of dipyridamole

Disulfiram: anticoagulant effect of coumarins enhanced by disulfiram

Dopaminergics: anticoagulant effect of warfarin enhanced by entacapone

Enteral Feeds: anticoagulant effect of coumarins antagonised by vitamin K (present in some enteral feeds)

Glucosamine: anticoagulant effect of warfarin enhanced by glucosamine (avoid concomitant use)

Hormone Antagonists: anticoagulant effect of coumarins possibly enhanced by bicalutamide and stenodimene; metabolism of coumarins inhibited by danazol (enhanced anticoagulant effect); anticoagulant effect of coumarins enhanced by flutamide and tamoxifen

Iloprost: anticoagulant effect of coumarins possibly enhanced by iloprost

Lactulose: anticoagulant effect of coumarins possibly enhanced by lactulose

Lefunomide: anticoagulant effect of warfarin possibly enhanced by leflunomide

Leukotriene Receptor Antagonists: anticoagulant effect of warfarin enhanced by zafirlukast
Appendix 1: Interactions

Coomarins (continued)

- Levamisole: anticoagulant effect of warfarin possibly enhanced by levamisole
- Lipid-regulating Drugs: anticoagulant effect of coomarins may be enhanced or reduced by colesteryramine; anticoagulant effect of warfarin may be transiently reduced by atorvastatin; anticoagulant effect of warfarin enhanced by fibrates, Atorvastatin and simvastatin; anticoagulant effect of coomarins possibly enhanced by ezetimibe and rosuvastatin
- Memantine: anticoagulant effect of warfarin possibly enhanced by memantine
- Oestrogens: anticoagulant effect of coomarins may be enhanced or reduced by oestrogens
- Orlistat: monitoring anticoagulant effect of warfarin recommended by manufacturer of orlistat
- Prasugrel: possible increased risk of bleeding when coomarins given with prasugrel
- Progestogens: anticoagulant effect of warfarin may be enhanced or reduced by progestogens
- Sildenafil: anticoagulant effect of warfarin antagonised by sildenafil
- Retinoids: anticoagulant effect of coomarins possibly reduced by acitretin
- Sildenafil: anticoagulant effect of warfarin enhanced by sildenafil
- Sulfinpyrazone: anticoagulant effect of coomarins enhanced by sulfinpyrazone
- Sympathomimetics: anticoagulant effect of coomarins possibly enhanced by methylphenidate
- Testolactone: anticoagulant effect of coomarins enhanced by testolactone
- Testosterone: anticoagulant effect of coomarins enhanced by testosterone
- Thyroid Hormones: anticoagulant effect of coomarins enhanced by thyroid hormones
- Ubidecarenone: anticoagulant effect of warfarin may be enhanced or reduced by ubidecarenone
- Ulcer-healing Drugs: metabolism of coomarins inhibited by omeprazole (enhanced anticoagulant effect); anticoagulant effect of coomarins possibly enhanced by esomeprazole, omeprazole and pantoprazole; absorption of coomarins possibly reduced by sucralfate (reduced anticoagulant effect)
- Vaccines: anticoagulant effect of warfarin possibly enhanced by influenza vaccine
- Vitamins: anticoagulant effect of coomarins possibly enhanced by vitamin E; anticoagulant effect of coomarins antagonised by vitamin K
- Cranberry Juice
- Anticoagulants: cranberry juice possibly enhances anticoagulant effect of coomarins—avoid concomitant use

Cycloclorizine see Antihistamines

Cyclopenthiazide see Diuretics

Cyclosporin see Ciclosporin

Cyclophosphamide
- Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antifungals: enhanced risk of agranulocytosis
- Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Cytotoxics: increased toxicity when high-dose cyclophosphamide given with pentostatin—avoid concomitant use
- Muscle Relaxants: cyclophosphamide enhances effects of suxamethonium

Cycloserine
- Alcohol: increased risk of convulsions when cycloserine given with alcohol
- Antibacterials: increased risk of CNS toxicity when cycloserine given with isoniazid
- Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 767

Cyprenalidine see Antihistamines

Cytrabine
- Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antifungals: cytrabine possibly reduces plasma concentration of flucytosine
- Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
- Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Cytotoxics: intracellular concentration of cytrabine increased by fludarabine

Cytoxics see individual drugs

Dabigatran Etepliate
- Analgesics: possible increased risk of bleeding when dabigatran etexilate given with NSAIDs; increased risk of haemorrhage when coomarins given with intravenous diltiazem; avoid concomitant use, including low-dose heparins; increased risk of haemorrhage when coomarins given with ketorolac (avoid concomitant use, including low-dose heparins)
- Anti-arrhythmics: plasma concentration of dabigatran etexilate increased by amiodarone (reduce dose of dabigatran etexilate)
- Calcium-channel Blockers: plasma concentration of dabigatran etexilate possibly increased by verapamil (reduce dose of dabigatran etexilate)

Dacarbazine
- Aldesleukin: avoidance of dacarbazine advised by manufacturer of aldesleukin
- Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
- Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Daily Products
- Antibacterials: daily products reduce absorption of ciprofloxacin and norfloxacin; daily products reduce absorption of tetracyclines (except doxycycline and minocycline)
- Eltrombopag: daily products possibly reduce absorption of eltrombopag (give at least 4 hours apart)

Dalteparin see Heparins

Danaazol
- Anticoagulants: danazol inhibits metabolism of coumarins (enhanced anticoagulant effect)
- Antiepileptics: danazol inhibits metabolism of carbamazepine (increased risk of toxicity)
- Ciclosporin: danazol inhibits metabolism of ciclosporin (increased plasma concentration)
- Lipid-regulating Drugs: possible increased risk of myopathy when danazol given with simvastatin
- Tacrolimus: danazol possibly increases plasma concentration of tacrolimus

Dantrolene see Muscle Relaxants

Dapsone
- Antibacterials: plasma concentration of dapsone reduced by rifampicin; plasma concentration of both drugs may increase when dapsone given with trimethoprim
- Antivirals: increased risk of ventricular arrhythmias when dapsone given with saquinavir—avoid concomitant use
- Probencid: excretion of dapsone reduced by probenecid (increased risk of side-effects)
- Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 767

Daptomycin
- Ciclosporin: increased risk of myopathy when daptomycin given with ciclosporin (preferably avoid concomitant use)
- Lipid-regulating Drugs: increased risk of myopathy when daptomycin given with fibrates or statins (preferably avoid concomitant use)
- Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 767
Darifenacin see Antimuscarinics

Darunavir
Ant-arrhythmics: darunavir possibly increases plasma concentration of lidocaine—avoid concomitant use
Antibacterials: darunavir increases plasma concentration of rifabutin (reduce dose of rifabutin); plasma concentration of darunavir significantly reduced by rifampicin—avoid concomitant use
Anticoagulants: avoidance of darunavir advised by manufacturer of rivaroxaban
Antidepressants: darunavir possibly reduces plasma concentration of paroxetine and sertraline; plasma concentration of darunavir reduced by St John’s wort—avoid concomitant use
Antiepileptics: plasma concentration of darunavir possibly reduced when darunavir given with carbamazepine and phenytoin
Antifungals: plasma concentration of both drugs increased when darunavir given with ketoconazole
Antimalarials: caution with darunavir advised by manufacturer of artemether/lumefantrine; darunavir possibly increases plasma concentration of quinine (increased risk of toxicity)
Antivirals: plasma concentration of darunavir reduced by efavirenz and saquinavir; plasma concentration of both drugs increased when darunavir given with indinavir; plasma concentration of darunavir reduced by lopinavir; also plasma concentration of lopinavir increased (avoid concomitant use); darunavir increases plasma concentration of maraviroc (consider reducing dose of maraviroc)
Barbiturates: plasma concentration of darunavir possibly reduced by phenobarbital
Cytotoxics: darunavir possibly increases plasma concentration of everolimus—manufacturer of everolimus advises avoid concomitant use
Lipid-regulating Drugs: darunavir possibly increases plasma concentration of pravastatin; possible increased risk of myopathy when darunavir given with rosuvastatin—manufacturer of rosuvastatin advises avoid concomitant use
Ranolazine: darunavir possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use
Dasatinib
Antibacterials: metabolism of dasatinib accelerated by rifampicin (reduced plasma concentration—avoid concomitant use)
Antiepileptics: cytoxotics possibly reduce absorption of phenytoin
Antifungals: plasma concentration of dasatinib possibly increased by ketoconazole
Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
Cardiac Glycosides: cytoxotics reduce absorption of digoxin tablets
Lipid-regulating Drugs: dasatinib possibly increases plasma concentration of simvastatin
Ulcer-healing Drugs: plasma concentration of dasatinib possibly reduced by famotidine
Deferasirox
Antacids: absorption of deferasirox possibly reduced by antacids containing aluminium (manufacturer of deferasirox advises avoid concomitant use)
Antibacterials: plasma concentration of deferasirox reduced by rifampicin
Antidiabetics: deferasirox increases plasma concentration of repaglinide
Antipsychotics and Hypnotics: deferasirox possibly reduces plasma concentration of midazolam
Deflazacort see Corticosteroids
Demeclocycline see Tetracyclines
Desferrioxamine
Antipsychotics: avoidance of desferrioxamine advised by manufacturer of levetiracetam; manufacturer of deferoxamine advises avoid concomitant use with prochlorperazine
Desflurane see Anaesthetics, General
Desloratadine see Antihistamines
Desmopressin
Analgesics: effects of desmopressin enhanced by indometacin
Loperamide: plasma concentration of oral desmopressin increased by loperamide
Desogestrel see Progestogens
Dexamethasone see Corticosteroids
Dexamfetamine see Sympathomimetics
Dexibuprofen see NSAIDs
Dexketoprofen see NSAIDs
Dextromethorphan see Opioid Analgesics
Dextropropoxyphene see Opioid Analgesics
Diamorphine see Opioid Analgesics
Diazepam see Anxiolytics and Hypnotics
Diazoxide
ACE Inhibitors: enhanced hypertensive effect when diazoxide given with ACE inhibitors
Adrenergic Neurone Blockers: enhanced hypertensive effect when diazoxide given with adrenergic neurone blockers
Alcohol: enhanced hypertensive effect when diazoxide given with alcohol
Aldesleukin: enhanced hypertensive effect when diazoxide given with aldesleukin
Alpha-blockers: enhanced hypertensive effect when diazoxide given with alpha-blockers
Anaesthetics, General: enhanced hypertensive effect when diazoxide given with general anaesthetics
Analgesics: hypertensive effect of diazoxide antagonised by NSAIDs
Angiotensin-II Receptor Antagonists: enhanced hypertensive effect when diazoxide given with angiotensin-II receptor antagonists
Antidpressants: enhanced hypertensive effect when diazoxide given with MAOIs or tricyclic-related antidepressants
Antidiabetics: diazoxide antagonises hypoglycaemic effect of antidiabetics
Antiepileptics: diazoxide reduces plasma concentration of phenytoin, also effect of diazoxide may be reduced
Antipsychotics: enhanced hypertensive effect when diazoxide given with phenothiazines
Anxiolytics and Hypnotics: enhanced hypertensive effect when diazoxide given with anxiolytics and hypnotics
Beta-blockers: enhanced hypertensive effect when diazoxide given with beta-blockers
Calcium-channel Blockers: enhanced hypertensive effect when diazoxide given with calcium-channel blockers
Clonidine: enhanced hypertensive effect when diazoxide given with clonidine
Corticosteroids: hypertensive effect of diazoxide antagonised by corticosteroids
Diuretics: enhanced hypertensive and hyperglycaemic effects when diazoxide given with diuretics
Dopaminergic: enhanced hypertensive effect when diazoxide given with levodopa
Methyldopa: enhanced hypertensive effect when diazoxide given with methyldopa
Moxisylyte: enhanced hypertensive effect when diazoxide given with moxisylyte
Moxonidine: enhanced hypertensive effect when diazoxide given with moxonidine
Muscle Relaxants: enhanced hypertensive effect when diazoxide given with baclofen or tizanidine
Nitrates: enhanced hypertensive effect when diazoxide given with nitrates
Prostaglandins: enhanced hypertensive effect when diazoxide given with alprostadil
Vasodilator Antihypertensives: enhanced hypertensive effect when diazoxide given with hydralazine, minoxidil or sodium nitroprusside
Diclofenac see NSAIDs
Diclofenac see NSAIDs
Diclofenac see NSAIDs
Diclofenac see NSAIDs
Diclofenac see NSAIDs
Diclofenac see NSAIDs
Diclofenac see NSAIDs
Diclofenac see NSAIDs
Diclofenac see NSAIDs
Diclofenac see NSAIDs
Diclofenac see NSAIDs
Diclofenac see NSAIDs
Diclofenac see NSAIDs
Diclofenac see NSAIDs
Diclofenac see NSAIDs
Didanosine

Note: Antacids in tablet formulation may affect absorption of other drugs.

- Allopurinol: plasma concentration of didanosine increased by allopurinol (risk of toxicity)—avoid concomitant use.

Analgesics: plasma concentration of didanosine possibly reduced by methadone.

- Antiarrhythmics: plasma concentration of didanosine possibly increased by ganclovir; increased risk of side-effects when didanosine given with irinotecan—avoid concomitant use; increased risk of side-effects when didanosine given with stavudine; plasma concentration of didanosine increased by tenofovir (increased risk of toxicity)—avoid concomitant use; plasma concentration of didanosine reduced by efavirenz.

- Cytotoxics: risk of toxicity when didanosine given with etidronate—avoid concomitant use.

Disopyramide see Prostaglandins

Digoxin see Cardiac Glycosides

Dihydrocodeine see Opoid Analgesics

Diltiazem see Calcium-channel Blockers

Dimercaprol

- Iron: avoid concomitant use of dimercaprol with iron.

- Dimethyl sulfoxide

Analgesics: avoid concomitant use of dimethyl sulfoxide with esulindac.

Dinoprost see Prostaglandins

Diphenoxylate see Antiarrhythmics

Dipyridamole

- Anaesthetics: absorption of dipyridamole possibly reduced by antacids.

- Antiarrhythmics: dipyridamole enhances and extends the effects of a-adrenoceptor antagonists (important risk of toxicity).

- Anticoagulants: antplatelet action of dipyridamole enhances anticoagulant effect of coumarins and phenindione; dipyridamole enhances anticoagulant effect of heparins.

- Clopidogrel: increased risk of bleeding when dipyridamole given with clopidogrel.

Cytotoxics: dipyridamole possibly reduces effects of fludarabine.

Disodium Etidrone see Bisphosphonates

Disodium Pamidronate see Bisphosphonates

Disopyramide

Anaesthetics, Local: increased myocardial depression when antiarrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine.

- Antiarrhythmics: increased myocardial depression when antiarrhythmics given with other antiarrhythmics; increased risk of ventricular arrhythmias when disopyramide given with amiodarone or dronedarone—avoid concomitant use.

- Antibacterials: plasma concentration of disopyramide possibly increased by clindamycin (increased risk of toxicity); plasma concentration of disopyramide increased by erythromycin (increased risk of toxicity); increased risk of ventricular arrhythmias when disopyramide given with moxifloxacin—avoid concomitant use; metabolism of disopyramide accelerated by rifampicin (reduced plasma concentration).

- Antidepressants: increased risk of ventricular arrhythmias when disopyramide given with tricyclics.

- Antidiabetics: disopyramide possibly enhances hypoglycaemic effect of glipizide, insulin and metformin.

- Antileukaemics: plasma concentration of disopyramide reduced by phenytoin; metabolism of disopyramide accelerated by primidone (reduced plasma concentration).

- Antifungals: increased risk of ventricular arrhythmias when disopyramide given with miconazole—avoid concomitant use; avoidance of disopyramide advised by manufacturer of miconazole.

Disopyramide (continued)

- Antihistamines: increased risk of ventricular arrhythmias when disopyramide given with mizolastine—avoid concomitant use.

- Antimalarials: avoidance of disopyramide advised by manufacturer of mefloquine/lumefantrine (risk of ventricular arrhythmias).

- Antiarrhythmics: risk of antimuscarinic side-effects when disopyramide given with antiarrhythmics; increased risk of ventricular arrhythmias when disopyramide given with olsateridine.

- Antipsychotics: increased risk of ventricular arrhythmias when antiarrhythmics that prolong the QT interval given with antipsychotics that prolong the QT interval; increased risk of ventricular arrhythmias when disopyramide given with amisulpride, droperidol, pimozide or zuclopenthixol—avoid concomitant use; possible increased risk of ventricular arrhythmias when disopyramide given with phenothiazines or sulpiride.

- Antituberculars: plasma concentration of disopyramide possibly increased by rifampicin (increased risk of toxicity); increased risk of ventricular arrhythmias when disopyramide given with rifampicin.

- Barbiturates: metabolism of disopyramide accelerated by barbiturates (reduced plasma concentration).

- Beta-blockers: increased myocardial depression when antiarrhythmics given with beta-blockers; increased risk of ventricular arrhythmias when disopyramide given with sotalol—avoid concomitant use.

- Calcium-channel Blockers: increased risk of myocardiad depression and asystole when disopyramide given with verapamil.

- Cytotoxics: increased risk of ventricular arrhythmias when disopyramide given with cisplatin.

- Diuretics: increased cardiac toxicity with disopyramide if hypokalaemia occurs with acetazolamide, loop diuretics or thiazides and related diuretics.

- Ivermectin: increased risk of ventricular arrhythmias when disopyramide given with ivermectin.

- Nitrate: disopyramide reduces effects of sublingual tablets of nitrates (failure to dissolve under tongue owing to dry mouth).

- Ranolazine: avoidance of disopyramide advised by manufacturer of ranolazine.

Distigmine see Parasympathomimetics

Disulfiram

Alcohol: disulfiram reaction when disulfiram given with alcohol (see p. 310).

- Antibacterials: psychotic reaction reported when disulfiram given with metronidazole; CNS effects of disulfiram possibly increased by isoniazid.

- Anticoagulants: disulfiram enhances anticoagulant effect of coumarins.

- Antidepressants: increased disulfiram reaction with alcohol reported with concomitant amitriptyline; disulfiram inhibits metabolism of tricyclics (increased plasma concentration).

- Antiepileptics: disulfiram inhibits metabolism of phenytoin (increased risk of toxicity).

- Anxiolytics and Hypnotics: disulfiram increases risk of temazepam toxicity; disulfiram inhibits metabolism of benzodiazepines (increased sedative effects).

- Paraldehyde: risk of toxicity when disulfiram given with paraldehyde.

Theophylline: disulfiram inhibits metabolism of theophylline (increased risk of toxicity).
Diuretics

- Note: Since systemic absorption may follow topical application of bromazepam to the eye, the possibility of interactions should be borne in mind.
- Note: Since systemic absorption may follow topical application of dorzolamide to the eye, the possibility of interactions should be borne in mind.
- ACE Inhibitors: enhanced hypertensive effect when diuretics given with •ACE inhibitors; increased risk of severe hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with •ACE inhibitors (monitor potassium concentration with low-dose spironolactone in heart failure).
- Adrenergic Neuron Blockers: enhanced hypertensive effect when diuretics given with adrenergic neuron blockers.
- Alcohol: enhanced hypertensive effect when diuretics given with alcohol.
- Aliskiren: plasma concentration of furosemide increased by aliskiren; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with aliskiren.
- Allopurinol: increased risk of hypersensitivity when thioureas and related diuretics given with allopurinol especially in renal impairment.
- Alpha-blockers: enhanced hypertensive effect when diuretics given with •alpha-blockers, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin.
- Analgesics: General: enhanced hypertensive effect when diuretics given with general analgesics.
- Antibacterials: (continued) hyperkalaemia when eplerenone given with trimethoprim.
- Antibiotics: possible increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with reboxetine; enhanced hypertensive effect when diuretics given with MAOIs; plasma concentration of eplerenone reduced by •SR John's wort—avoid concomitant use; increased risk of postural hypotension when diuretics given with tricyclics.
- Anti-diabetics: loop diuretics and thiazides and related diuretics antagonise hypoglycaemic effect of anti-diabetics.
- Antiepileptics: plasma concentration of eplerenone reduced by •carbamazepine and •phenytoin—avoid concomitant use; increased risk of hyperkalaemia when diuretics given with carbamazepine; acetazolamide increases plasma concentration of •carbamazepine; effects of furosemide antagonised by phenytoin; acetazolamide possibly increases plasma concentration of •phenytoin; increased risk of osteomalacia when carbonic anhydrase inhibitors given with phenytoin or primidone; acetazolamide possibly reduces plasma concentration of primidone; hydrochlorothiazide possibly increases plasma concentration of toprimate.
- Antifungals: increased concentration of furosemide; plasma concentration of eplerenone increased by •itraconazole and •ketoconazole—avoid concomitant use; increased risk of hyperkalaemia when loop diuretics or thiazides and related diuretics given with amphoterin; hydrochlorothiazide increases plasma concentration of •fluconazole; plasma concentration of eplerenone increased by fluconazole (reduce dose of eplerenone).
- Antipsychotics: hyperkalaemia caused by diuretics increases risk of ventricular arrhythmias with •amisulpride; enhanced hypertensive effect when diuretics given with phenoxyazines; hyperkalaemia caused by diuretics increases risk of ventricular arrhythmias with •epimizide (avoid concomitant use).
- Antivirals: plasma concentration of eplerenone increased by •nelfinavir and •ritonavir—avoid concomitant use; increased risk of hyperkalaemia when loop diuretics or thiazides and related diuretics given with saquinavir (reduce dose of eplerenone).
- Anaesthetics, General: enhanced hypertensive effect when diuretics given with general anaesthetics.
- Antidiabetics: increased concentration of furosemide; plasma concentration of eplerenone increased by •itraconazole and •ketoconazole—avoid concomitant use; increased risk of hyperkalaemia when loop diuretics or thiazides and related diuretics given with amphoterin; hydrochlorothiazide increases plasma concentration of •fluconazole; plasma concentration of eplerenone increased by fluconazole (reduce dose of eplerenone).
- Antiarrhythmics: plasma concentration of eplerenone increased by amiodarone (reduce dose of eplerenone); hyperkalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with amiodarone; hyperkalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with •disopyramide; hyperkalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with •ticlidin—avoid concomitant use; hyperkalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics antagonise action of •lidocaine.
- Antihistamines: plasma concentration of eplerenone increased by •clarithromycin and •erythromycin—avoid concomitant use; plasma concentration of eplerenone reduced by •erythromycin (reduce dose of eplerenone); plasma concentration of eplerenone reduced by •clarithromycin—avoid concomitant use; avoidance of diuretics advised by manufacturer of lymecycline; increased risk of otoxicity when loop diuretics given with •aminoglycosides.
- Antiinfectives: plasma concentration of eplerenone increased by •clarithromycin and •erythromycin—avoid concomitant use; plasma concentration of eplerenone increased by •ditiazem and •verapamil (reduce dose of eplerenone).
- Antidiabetic: plasma concentration of eplerenone increased by •digoxin—potassium sparing diuretics such as metolazone and spironolactone increases plasma concentration of •digoxin.
- Antidiabetic: plasma concentration of eplerenone increased by •digoxin—potassium sparing diuretics such as metolazone and spironolactone increases plasma concentration of •digoxin.
- Antihypertensive: plasma concentration of eplerenone increased by •digoxin—potassium sparing diuretics such as metolazone and spironolactone increases plasma concentration of •digoxin.
- Antimicrobial: plasma concentration of eplerenone increased by •digoxin—potassium sparing diuretics such as metolazone and spironolactone increases plasma concentration of •digoxin.
- Antifungal: plasma concentration of eplerenone increased by •digoxin—potassium sparing diuretics such as metolazone and spironolactone increases plasma concentration of •digoxin.
- Antimicrobial: plasma concentration of eplerenone increased by •digoxin—potassium sparing diuretics such as metolazone and spironolactone increases plasma concentration of •digoxin.
- Antihypertensive: plasma concentration of eplerenone increased by •digoxin—potassium sparing diuretics such as metolazone and spironolactone increases plasma concentration of •digoxin.
- Antimicrobial: plasma concentration of eplerenone increased by •digoxin—potassium sparing diuretics such as metolazone and spironolactone increases plasma concentration of •digoxin.
- Antihypertensive: plasma concentration of eplerenone increased by •digoxin—potassium sparing diuretics such as metolazone and spironolactone increases plasma concentration of •digoxin.
Diuretics (continued)

- Ciclosporin: increased risk of nephrotoxicity and possibly hypermagnesaemia when thiazides and related diuretics given with ciclosporin; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with ciclosporin; acetazolamide possibly increases plasma concentration of ciclosporin.
- Clopidogrel: enhanced hypotensive effect when diuretics given with clopidogrel.

Corticosteroids: diuretic effect of diuretics antagonised by corticosteroids; increased risk of hyperkalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with corticosteroids.

- Cytotoxics: alkaline urine due to acetazolamide increases excretion of methotrexate; hyperkalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases risk of ventricular arrhythmias with arsenic trioxide; avoidance of spiranoxonoleate advised by manufacturer of mitotane (antagonism of effect); increased risk of nephrotoxicity and ototoxicity when diuretics given with platinum compounds.

Diazoxide: enhanced hypotensive and hyperglycaemic effects when diuretics given with diazoxide.

Diuretics: increased risk of hyperkalaemia when loop diuretics or thiazides and related diuretics given with acetazolamide; profound diuresis possible when metolazone given with furosemide; increased risk of hyperkalaemia when thiazides and related diuretics given with loop diuretics.

Dopaminergics: enhanced hypotensive effect when diuretics given with levodopa.

Hormone Antagonists: increased risk of hypercalcaemia when thiazides and related diuretics given with toremifene; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with triostane.

Lipid-regulating Drugs: absorption of thiazides and related diuretics reduced by colestipol and colestyramine (give at least 2 hours apart).

- Lithium: loop diuretics and thiazides and related diuretics reduce excretion of lithium (increased plasma concentration and risk of toxicity)—loop diuretics safer than thiazides; potassium-sparing diuretics and aldosterone antagonists reduce excretion of lithium (increased plasma concentration and risk of toxicity); acetazolamide increases the excretion of lithium.

MethylpGameObject: enhanced hypotensive effect when diuretics given with methylpGameObject.

Moxisylyte: enhanced hypotensive effect when diuretics given with moxisylyte.

Moxonidine: enhanced hypotensive effect when diuretics given with moxonidine.

Muscle Relaxants: enhanced hypotensive effect when diuretics given with baclofen or tizanidine.

Nitrates: enhanced hypotensive effect when diuretics given with nitrates.

- Oestrogens: diuretic effect of diuretics antagonised by oestrogens.

Potassium Salts: increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with potassium salts.

Progestogens: risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with drospirenone (monitor serum potassium during first cycle).

Prostaglandins: enhanced hypotensive effect when diuretics given with alprostadil.

- Sympathomimetics, Beta: increased risk of hyperkalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with high doses of beta, sympathomimetics—see Hypokalaemia, p. 176.
Droxazosin see Alpha-blockers
Doxepin see Antidepressants, Tricyclic
Doxorubicin
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
Anti-psychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
Antivirals: doxorubicin possibly inhibits effects of stavudine
Cardiac Glycosides: cytotoxins reduce absorption of digoxin tablets
Ciclosporin: increased risk of neurotoxicity when doxorubicin given with ciclosporin
Cytotoxics: plasma concentration of doxorubicin possibly increased by soralfenib

Doxycline see Tetracyclines

Dronedarone
Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine
Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other anti-arrhythmics; increased risk of ventricular arrhythmias when dronedarone given with amiodarone
Anti-psychotics—avoid concomitant use
Antibacterials: manufacturers of dronedarone advises avoid concomitant use with erithromycin or telithromycin (risk of ventricular arrhythmias); plasma concentration of dronedarone possibly increased by erythromycin (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of dronedarone reduced by trifluperidol—avoid concomitant use
Antidepressants: plasma concentration of dronedarone possibly reduced by carbamazepine and phenytoin—avoid concomitant use
Anti-fungals: plasma concentration of dronedarone increased by fluconazole—avoid concomitant use; manufacturer of dronedarone advises avoid concomitant use with itraconazole, posaconazole and voriconazole
Anti-psychotics: increased risk of ventricular arrhythmias when dronedarone given with metaflonothiazines (risk of ventricular arrhythmias)
Antivirals: manufacturer of dronedarone advises avoid concomitant use with ritonavir; increased risk of ventricular arrhythmias when dronedarone given with saquinavir—avoid concomitant use
Barbiturates: plasma concentration of dronedarone possibly reduced by phenobarbital—avoid concomitant use
Beta-blockers: increased myocardial depression when anti-arrhythmics given with beta-blockers; dronedarone possibly increases plasma concentration of metoprolol and propranolol; increased risk of ventricular arrhythmias when dronedarone given with nisoldipine—avoid concomitant use
Calcium-channel Blockers: plasma concentration of dronedarone increased by nifedipine; increased risk of bradycardia and myocardial depression when dronedarone given with nisoldipine and verapamil
Cardiac Glycosides: dronedarone increases plasma concentration of digoxin (halve dose of digoxin)
Grapefruit juice: plasma concentration of dronedarone increased by grapefruit juice—avoid concomitant use
Lipid-regulating Drugs: increased risk of myopathy when dronedarone given with simvastatin
Sirolimus: manufacturer of dronedarone advises caution with sirolimus

Dronedarone (continued)
Tacrolimus: manufacturer of dronedarone advises caution with tacrolimus
Droperidol see Antipsychotics
Dropsirenone see Progestogens
Drotrecogin Alfa
Anti-coagulants: manufacturer of drotrecogin alfa advises avoid concomitant use with high doses of heparin—consult product literature

Duloxetine
Analgesics: possible increased serotonergic effects when duloxetine given with pethidine or tramadol
Anti-bacterials: metabolism of duloxetine inhibited by ciprofloxacin—avoid concomitant use
Anti-psychotics: metabolism of duloxetine inhibited by fluvoxamine—avoid concomitant use; posaconazole increased serotonergic effects when duloxetine given with SSRIs, St John’s wort, amitriptyline, clonipramine, moclobemide, tryptophan or venlafaxine; duloxetine should not be started until 2 weeks after stopping MAOIs, also MAOIs should not be started until at least 5 days after stopping duloxetine; after stopping SSRi-related antidepressants do not start moclobemide for at least 1 week
Antimalarials: avoidance of antidepressants advised by manufacturer of artemether/lumefantrine
Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine
SHT, Agonists: possible increased serotonergic effects when duloxetine given with SHT, agonists

Dutasteride
Calcium-channel Blockers: plasma concentration of dutasteride increased by diltiazem and verapamil

Dydrogesterone see Progestogens
Edrophonium see Parasympathomimetics
Efavirenz
Analgesics: efavirenz reduces plasma concentration of methadone
Anti-bacterials: increased risk of rash when efavirenz given with clarithromycin; efavirenz reduces plasma concentration of rifabutin—increased dose of rifabutin; plasma concentration of efavirenz reduced by rifampin—increased dose of efavirenz
Anti-coagulants: efavirenz possibly affects plasma concentration of warfarin
Antidepressants: plasma concentration of efavirenz reduced by St John’s wort—avoid concomitant use
Antiepileptics: plasma concentration of both drugs reduced when efavirenz given with carbamazepine
Antifungals: efavirenz reduces plasma concentration of itraconazole and posaconazole; efavirenz reduces plasma concentration of voriconazole, also plasma concentration of efavirenz increased (increase voriconazole dose and reduce efavirenz dose); efavirenz possibly reduces plasma concentration of caspofungin—consider increasing dose of caspofungin
Antipsychotics: efavirenz possibly reduces plasma concentration of olanzapine—dose efavirenz concentrations of olanzapine, risperidone, quetiapine, zuclopenthixol, and clozapine—consider increasing dose of olanzapine
Antivirals: avoidance of efavirenz advised by manufacturer of atazanavir (plasma concentration of atazanavir reduced); efavirenz reduces plasma concentration of darunavir, fosamprenavir and indinavir; efavirenz possibly reduces plasma concentration of etravirine—avoid concomitant use; efavirenz reduces plasma concentration of maraviroc—consider increasing dose of maraviroc; plasma concentration of efavirenz reduced by nevirapine; toxicity of efavirenz increased by ritonavir, monitor liver function tests; efavirenz significantly reduces plasma concentration of saquinavir
Appendix 1: Interactions

**Efarinaz (continued)**
- Antiulcer: increases risk of protracted sedation when efarinaz given with selegiline—avoid concomitant use
- Calcium-channel Blockers: efarinaz reduces plasma concentration of diltiazem
- Ciclosporin: efarinaz reduces plasma concentration of ciclosporin
- Ergot Alkaloids: increased risk of ergotism when efarinaz given with ergot alkaloids—avoid concomitant use
- Grapefruit Juice: plasma concentration of efarinaz possibly increased by grapefruit juice
- Lipid-Regulating Drugs: efarinaz reduces plasma concentration of atorvastatin, pravastatin and simvastatin
- Oestrogens: efarinaz reduces contraceptive effect of oestrogens
- Progestogens: efarinaz reduces contraceptive effect of progestogens
- Tacrolimus: efarinaz possibly affects plasma concentration of tacrolimus
- Eptifibatide see SHT, Agonists

**Eltrombopag**
- Antacids: absorption of eltrombopag reduced by antacids (give at least 4 hours apart)
- Antivirals: plasma concentration of eltrombopag possibly reduced by lopinavir
- Calcium Salts: absorption of eltrombopag possibly reduced by calcium salts (give at least 4 hours apart)
- Dairy Products: absorption of eltrombopag possibly reduced by dairy products (give at least 4 hours apart)
- Iron: absorption of eltrombopag possibly reduced by oral iron (give at least 4 hours apart)
- Lipid-Regulating Drugs: eltrombopag increases plasma concentration of rosuvastatin (consider reducing dose of rosuvastatin)
- Selenium: absorption of eltrombopag possibly reduced by selenium (give at least 4 hours apart)
- Zinc: Absorption of eltrombopag possibly reduced by zinc (give at least 4 hours apart)

**Emtricitabine**
- Antivirals: manufacturer of emtricitabine advises avoid concomitant use with lamivudine

**Enalapril** see ACE Inhibitors

**Enoxaparin** see Heparins

**Enoximone** see Phosphodiesterase Inhibitors

**Entacapone**
- Anti-CoA synthase: entacapone enhances anticoagulant effect of warfarin
- Antidepressants: manufacturer of entacapone advises caution with moclobemide, paroxetine, tricyclics and venlafaxine; avoid concomitant use of entacapone with non-selective MAOIs
- Dopaminergics: entacapone possibly enhances effects of amphetamine; entacapone possibly reduces plasma concentration of rasagiline; manufacturer of entacapone advises max. dose of 10 mg selegiline if used concomitantly
- Iron: absorption of entacapone reduced by oral iron
- Memantine: effects of dopaminergics possibly enhanced by memantine

**Methyldopa:** entacapone possibly enhances effects of methyldopa; antiparkinsonian effect of dopaminergics antagonised by methyldopa
- Symptomamimetics: entacapone possibly enhances effects of adrenaline (epinephrine), dobutamine, dopamine and noradrenaline (norepinephrine)

**Enteral Foods**
- Anti-CoA synthase: the presence of vitamin K in some enteral feeds can antagonise the anticoagulant effect of coumarins and phenindione
- Antiepileptics: enteral feeds possibly reduce absorption of phenytoin
- Ephedrine see Sympathomimetics
- Epinephrine (adrenaline) see Sympathomimetics

**Epirubicin**
- Antiepileptics: cytoxotics possibly reduce absorption of phenytoin
- Anti-CoA synthase: avoid concomitant use of cytoxotics with oxapiprazine (increased risk of agranulocytosis)
- Cardiac Glycosides: cytoxotics reduce absorption of digoxin tablets
- Ciclosporin: plasma concentration of epirubicin increased by ciclosporin
- Ulcer-healing Drugs: plasma concentration of epirubicin increased by cimetidine

**Eplerenone** see Diuretics

**Eprosartan** see Angiotensin-II Receptor Antagonists

**Eptifibatide**
- Iloprost: increased risk of bleeding when eptifibatide given with iloprost

**Ergot Alkaloids**
- Anaesthetics, General: effects of ergotamine on the parturient uterus reduced by halothane
- Antibacterials: increased risk of ergotamine and methysergide given with macrolides or etidronate—avoid concomitant use; increased risk of ergotism when ergotamine and methysergide given with tetracyclines
- Antidepressants: possible risk of hypertension when ergotamine and methysergide given with reboxetine
- Antifungals: increased risk of ergotamine and methysergide given with triazoles—avoid concomitant use
- Antivirals: plasma concentration of ergot alkaloids possibly increased by azithromycin—avoid concomitant use; increased risk of ergotism when ergotamine and methysergide given with efavirenz—avoid concomitant use; increased risk of ergotism when ergotamine and methysergide given with felodipine, felodipine, nelfinavir, ritonavir or saquinavir—avoid concomitant use
- Beta-blockers: increased peripheral vasoconstriction when ergotamine and methysergide given with beta-blockers
- SHT, Agonists: increased risk of vasospasm when ergotamine and methysergide given with almotriptan, eletriptan, frovatriptan or naratriptan avoid concomitant use
- Ergot Alkaloids see Ergot Alkaloids

**Erlotinib**
- Analgesics: increased risk of bleeding when erlotinib given with NSAIDs
- Antacids: plasma concentration of erlotinib possibly reduced by antacids—give antacids at least 4 hours before or 2 hours after erlotinib
- Antibacterials: plasma concentration of erlotinib increased by ciprofloxacin; metabolism of erlotinib accelerated by rifampicin (reduced plasma concentration)
- Antiepileptics: increased risk of bleeding when erlotinib given with coumarins
- Symptomamimetics: cytoxotics possibly reduce absorption of phenytoin
- Antifungals: metabolism of erlotinib inhibited by ketoconazole (increased plasma concentration)
Erlotinib (continued)

- Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
- Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Cytotoxics: plasma concentration of erlotinib possibly increased by capecitabine
- Ulcer-healing Drugs; manufacturer of erlotinib advises avoid concomitant use with cimetidine,esomeprazole, famotidine, lansoprazole, nizatidine, pantoprazole and rabeprazole; plasma concentration of erlotinib reduced by ranitidine—manufacturer of erlotinib advises give at least 2 hours before or 10 hours after ranitidine; plasma concentration of erlotinib reduced by omeprazole—manufacturer of erlotinib advises avoid concomitant use

Etapenem

- Antiepileptics: carbapenems reduce plasma concentration of valproate—avoid concomitant use
- Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 767

Erythromycin see Macrolides

Escitalopram see Antidepressants, SSRI

Eticarbazepine

Anticoagulants: eslicarbazepine reduces plasma concentration of warfarin—see p. 767
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (conversive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclics (conversive threshold lowered); avoid concomitant use of antiepileptics with St John’s wort
- Antiepileptics: plasma concentration of both drugs reduced when eslicarbazepine given with carbamazepine; manufacturer of eslicarbazepine advises avoid concomitant use with oxcarbazepine; plasma concentration of eslicarbazepine reduced by phenytoin, also plasma concentration of phenytoin increased
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by fenofibrate
- Oestrogens: eslicarbazepine accelerates metabolism of oestrogens (reduced contraceptive effect—see p. 495)
- Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat
- Progestogens: eslicarbazepine accelerates metabolism of progestogens (reduced contraceptive effect—see p. 495)

Esmolol see Beta-blockers

Esomeprazole see Proton Pump Inhibitors

Estradiol see Oestrogens

Estramustine

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
- Bisphosphonates: plasma concentration of estramustine increased by sodium clodronate
- Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Estriol see Oestrogens

Estrone see Oestrogens

Etanercept

- Abatacept: avoid concomitant use of etanercept with abatacept
- Anakinra: avoid concomitant use of etanercept with anakinra
- Vaccines: avoid concomitant use of etanercept with live vaccines see Oestrogens

Ethinylestradiol see Oestrogens

Ethisuximide (continued)

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (conversive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclics (conversive threshold lowered); avoid concomitant use of antiepileptics with St John’s wort
- Antiepileptics: plasma concentration of ethosuximide possibly reduced by carbamazepine and primidone; plasma concentration of ethosuximide possibly reduced by phenytoin, also plasma concentration of phenytoin possibly increased, plasma concentration of ethosuximide possibly increased by valproate
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by fenofibrate
- Oestrogens (reduced contraceptive effect—see p. 767)

Etoricoxib see NSAIDs

Etoposide

- Anticoagulants: etoposide possibly enhances anticoagulant effect of coumarins
- Antiepileptics: plasma concentration of etoposide possibly reduced by phenytoin; cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
- Barbiturates: plasma concentration of etoposide possibly reduced by phenobarbital
- Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Etomoxir see NSAIDs

Etravirine

- Antibacterials: plasma concentration of etravirine increased by clarithromycin, also plasma concentration of clarithromycin reduced; plasma concentration of both drugs reduced when etravirine given with rifabutin; manufacturer of etravirine advises avoid concomitant use with rifampicin
- Antiepileptics: manufacturer of etravirine advises avoid concomitant use with St John’s wort
- Antipsychotics: manufacturer of etravirine advises avoid concomitant use with carbamazepine and phenytoin
- Antivirals: plasma concentration of etravirine possibly reduced by efavirenz and nevirapine—avoid concomitant use; etravirine increases plasma concentration of fosamprenavir (consider reducing dose of fosamprenavir); etravirine possibly reduces plasma concentration of enfuvirtide—avoid concomitant use; plasma concentration of enfuvirtide reduced by tipranavir, also plasma concentration of tipranavir increased (avoid concomitant use)
- Barbiturates: manufacturer of etravirine advises avoid concomitant use with phenobarbital
- Cardiac Glycosides: etravirine increases plasma concentration of digoxin
- Lipid-regulating Drugs: etravirine possibly reduces plasma concentration of atorvastatin

Sildenafil: etravirine reduces plasma concentration of sildenafil

BNF 61 Appendix 1: Interactions 841
Antivirals: see Progestogens

**Etonidazole**

**Everolimus**
- Antiarrhythmics: plasma concentration of everolimus possibly increased by citalopram and escitalopram—manufacturer of everolimus advises avoid concomitant use; plasma concentration of everolimus increased by erythromycin; plasma concentration of everolimus reduced by famotidine and ticlopidine—manufacturer of everolimus advises avoid concomitant use
- Antiarrhythmics: plasma concentration of everolimus increased by ketocana zole—avoid concomitant use; plasma concentration of everolimus possibly increased byitraconazole and posaconazole and voriconazole—manufacturer of everolimus advises avoid concomitant use
- Antipsychotics: avoid concomitant use of cytotoxic with clozapine (increased risk of agranulocytosis)
- Antivirals: plasma concentration of everolimus possibly increased by nelfinavir, ritonavir and saquinavir—manufacturer of everolimus advises avoid concomitant use
- Calcium-channel Blockers: plasma concentration of both drugs may increase when everolimus given with verapamil
- Cardiac Glycosides: cytotoxic reactions absorption of digoxin tablets
- Ciclosporin: plasma concentration of everolimus increased by ciclosporin
- Grapefruit Juice: manufacturer of everolimus advises avoid concomitant use with grapefruit juice
- Exemestane
  - Antibacterials: plasma concentration of exemestane possibly reduced by rifampicin
- Ezetimibe
  - Antiarrhythmics: ciclosporin possibly enhances antiarrhythmic effect of cuminarins
  - Ciclosporin: plasma concentration of both drugs may increase when everolimus given with ciclosporin
- Lipid-regulating Drugs: increased risk of cholelithiasis and gallbladder disease when fibrates given with ezetimibe—discontinue if suspected; increased risk of myopathy when fibrates given with statins; increased risk of myopathy when gemfibrozil given with statins (preferably avoid concomitant use)

**Fibrates (continued)**
- Ciclosporin: increased risk of renal impairment when bezafibrate or fenofibrate given with ciclosporin
- Colchicine: possible increased risk of myopathy when fibrates given with colchicine
- Cyttoxotics: gemfibrozil increases plasma concentration of bevacizumab—avoid concomitant use
- Lipid-regulating Drugs: increased risk of cholelithiasis and gallbladder disease when fibrates given with ezetimibe—discontinue if suspected; increased risk of myopathy when fibrates given with statins
- Lipid-regulating Drugs: increased risk of myopathy when gemfibrozil given with statins (preferably avoid concomitant use)

**Flagstatin**
- Note Pegfluglumastat interactions as for flagstatin
- Cytotoxic reactions: neutropenia possibly exacerbated when Flagstatin given with fluorouracil

**Flavoxate** see Antimuscarinics

**Flecainide**
- Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, ropivacaine, prilocaine or ropivacaine
- Antiarrhythmics: increased myocardial depression when anti-arrhythmics given with other anti-arrhythmics; plasma concentration of flecainide increased by amiodarone (half dose of flecainide)
- Antidepressants: plasma concentration of flecainide increased by fluoxetine; increased risk of ventricular arrhythmias when flecainide given with tricyclics
- Antiinflammatory: increased risk of ventricular arrhythmias when flecainide given with nitrofurantoin—avoid concomitant use
- Antimalarials: avoidance of flecainide advised by manufacturer of artesunate/lumefantrine (risk of ventricular arrhythmias); plasma concentration of flecainide increased by quinine
- Antimuscarinics: increased risk of ventricular arrhythmias when flecainide given with tolterodine
- Antiarrhythmics: increased risk of ventricular arrhythmias when anti-arrhythmics given with amiodarone that prolong the QT interval with antiarrhythmics that prolong the QT interval; increased risk of arrhythmias when flecainide given with clozapine
- Antiarrhythmics: plasma concentration of flecainide possibly increased by fosamprenavir, indinavir, lopinavir and ritonavir (increased risk of ventricular arrhythmias—avoid concomitant use); increased risk of ventricular arrhythmias when flecainide given with amiodarone—avoid concomitant use
- Beta-blockers: increased risk of myocardial depression and bradycardia when flecainide given with beta-blockers; increased myocardial depression when anti-arrhythmics given with beta-blockers
- Calcium-channel Blockers: increased risk of myocardial depression and asystole when flecainide given with verapamil
- Diuretics: increased cardiac toxicity with flecainide if hyponatraemia occurs with amiodarone, loop diuretics or thiazides and related diuretics
- Ulcer-healing Drugs: metabolism of flecainide inhibited by cilostazol (increased plasma concentration)

**Flucloxacinil** see Penicillins

**Flucloxacillin**
- see Antimuscarinics

**Flucytosine**
- see Antiinfectious, Triazole

**Fludarabine**
- Antiarrhythmics: decreased cell uptake increased by amphotericin (toxicity possibly increased)
- Anticytotoxic: plasma concentration of fludarabine possibly reduced by cytarabine

**Fluticasone**
- Antiinfectious: avoid concomitant use of cytoxotics with dexamethasone (increased risk of agranulocytosis)
- Cardiac Glycosides: cytotoxic reactions absorption of digoxin tablets
BNF 61

Appendix 1: Interactions 843

Fosamprenavir (continued)

Anticoagulants: fosamprenavir may enhance or reduce anticoagulant effect of coumarins; avoidance of fosamprenavir advised by manufacturer of rivaroxaban

Antidepressants: plasma concentration of fosamprenavir reduced by St John’s wort; avoid concomitant use

Antiepileptics: plasma concentration of fosamprenavir possibly reduced by carbamazepine

Antifungals: fosamprenavir increases plasma concentration of ketoconazole (also plasma concentration of fosamprenavir possibly increased); plasma concentration of both drugs may increase when fosamprenavir given with itraconazole

Antimalarials:

Lipid-regulating Drugs:

Anti-arrhythmics:

Fluorides

Corticosteroids

Folic Acid

Cytotoxics:

Antipsychotics:

Anticoagulants:

Analgesics:

Barbiturates:

Antimuscarinics:

Flubrocaine see Corticosteroids

Flunisolide see Corticosteroids

Fludarabine (continued)

Cytoxics: fludarabine increases intracellular concentration of cytarabine; increased pulmonary toxicity when fludarabine given with pentostatin (unacceptably high incidence of fatalities)

Dipyridamole: effects of fludarabine possibly reduced by dipyridamole

Fludrocortisone see Corticosteroids

Flutamide

Flurazepam

Flupentixol

Fluoxetine

Fluorides

Calcium Salts: absorption of fluorides reduced by calcium salts

Fluorouracil

Note: Capecitabine is a prodrug of fluorouracil

Note: Tegafur is a prodrug of fluorouracil

Allpurinol: manufacturer of capecitabine advises avoid concomitant use with allpurinol

Antibacterials: metabolism of fluorouracil inhibited by metronidazole (increased toxicity)

Anticoagonulants: fluorouracil enhances anticoagulant effect of coumarins

Antiepileptics: fluorouracil possibly inhibits metabolism of phenytoin (increased risk of toxicity); cytoxotics possibly reduce absorption of phenytoin

Antipsychotics: avoid concomitant use of cytoxotics with olanzapine (increased risk of agranulocytosis) Cardiac Glycosides: cytoxotics reduce absorption of digoxin tablets

Cytoxotics: capecitabine possibly increases plasma concentration of erlotinib

Filgrastim: neutropenia possibly exacerbated when fluorouracil given with filgrastim

Temoporfin: increased skin photosensitivity when topical fluouracil used with temoporfin

Ulcet-healing Drugs: metabolism of fluorouracil inhibited by cimetidine (increased plasma concentration)

Fluoxetine see Antidepressants, SSRI

Fluphenazine see Antipsychotics

Flurazepam see Anxiolytics and Hypnotics

Flurbiprofen see NSAIDs

Flutamide

Anticoagonulants: fluamidine enhances anticoagulant effect of coumarins

Fluticasone see Corticosteroids

Fluvastatin see Statins

Fluvaxamine see Antidepressants, SSRI

Folates

Aminosaliclyates: absorption of folate possibly reduced by sulfasalazine

Antiepileptics: folates possibly reduce plasma concentration of phenytoin and primidone

Barbiturates: folates possibly reduce plasma concentration of phenobarbital

Cytoxotics: avoidance of folates advised by manufacturer of raltitrexed

Folic Acid see Folates

Folic Acid see Folates

Fomoterol see Sympathomimetics, Beta, Fosamprenavir

Note: Fosamprenavir is a prodrug of amprenavir

Analgesics: fosamprenavir reduces plasma concentration of methadone

Anti-arrhythmics: fosamprenavir possibly increases plasma concentration of amiodarone, bepridil and propafenone (increased risk of ventricular arrhythmias—avoid concomitant use); fosamprenavir possibly increases plasma concentration of midodrine—avoid concomitant use

Antibacterials: fosamprenavir increases plasma concentration of rifabutin (reduce dose of rifabutin); plasma concentration of fosamprenavir significantly reduced by rifampicin—avoid concomitant use; avoidance of concomitant fosamprenavir in severe renal and hepatic impairment advised by manufacturer of olodaterol

Foscarnet

Amitriptyline is based on the use of fosfomycin

Methotrexate—manufacturer of capecitabine advises avoid concomitant use; plasma concentration of both drugs may increase when fosamprenavir given with irtraconazole

Anxiolytics and Hypnotics: fosamprenavir possibly increases plasma concentration of midazolam (risk of prolonged sedation—avoid concomitant use of oral midazolam)

Barbiturates: plasma concentration of fosamprenavir possibly reduced by phenobarbital

Ciclosporin: fosamprenavir increases plasma concentration of ciclosporin

Ergot Alkaloids: increased risk of ergotism when fosamprenavir given with ergotamine and methysergide—avoid concomitant use

Lipid-regulating Drugs: possible increased risk of myopathy when fosamprenavir given with atorvastatin; possible increased risk of myopathy when fosamprenavir given with rosuvastatin—manufacturer of rosuvastatin advises avoid concomitant use; possible increased risk of myopathy when fosamprenavir given with simvastatin—avoid concomitant use

Ranolazine: fosamprenavir possibly increases plasma concentration of etravirine—manufacturer of etravirine advises avoid concomitant use

Sildenafil: fosamprenavir possibly increases plasma concentration of sildenafil

Tacrolimus: fosamprenavir increases plasma concentration of tacrolimus

Tadalafil: manufacturer of tadalafil advises avoid concomitant use

Vardenafil: fosamprenavir possibly increases plasma concentration of vardenafil

Fosaprepitant see Aprepitant

Foscarin

Antivirals: avoidance of foscarin advised by manufacturer of lamivudine

Pentamidine isethionate: increased risk of hypocalcaemia when foscarin given with pentamidine isethionate

Fosinopril see ACE Inhibitors

Fosphenytoin see Phenytoin

Framycetin see Aminoglycosides

Frovatriptan see 5HT, Agonists

Furosemide see Diuretics

fosamprenavir increases plasma concentration of etravirine (consider reducing dose of fosamprenavir); plasma concentration of fosamprenavir reduced by lopinavir, effect on lopinavir plasma concentration not predictable—avoid concomitant use; plasma concentration of fosamprenavir possibly reduced by nevirapine

Antivirals: plasma concentration of fosamprenavir reduced by efavirenz and etravirine; plasma concentration of fosamprenavir increased by etravirine (consider reducing dose of fosamprenavir); plasma concentration of fosamprenavir reduced by lopinavir, effect on lopinavir plasma concentration not predictable—avoid concomitant use; plasma concentration of fosamprenavir possibly reduced by nevirapine

Antipsychotics: fosamprenavir possibly inhibits metabolism of amiprazole (reduce dose of amiprazole); fosamprenavir increases plasma concentration of olanzapine (increased risk of toxicity) Antimuscarnicines: avoidance of fosamprenavir advised by manufacturer of darifenacin and tolterodine

Foscarnet

Amitriptyline is based on the use of fosfomycin

Methotrexate—manufacturer of capecitabine advises avoid concomitant use; plasma concentration of both drugs may increase when fosamprenavir given with irtraconazole

Anxiolytics and Hypnotics: fosamprenavir possibly increases plasma concentration of midazolam (risk of prolonged sedation—avoid concomitant use of oral midazolam)

Barbiturates: plasma concentration of fosamprenavir possibly reduced by phenobarbital

Ciclosporin: fosamprenavir increases plasma concentration of ciclosporin

Ergot Alkaloids: increased risk of ergotism when fosamprenavir given with ergotamine and methysergide—avoid concomitant use

Lipid-regulating Drugs: possible increased risk of myopathy when fosamprenavir given with atorvastatin; possible increased risk of myopathy when fosamprenavir given with rosuvastatin—manufacturer of rosuvastatin advises avoid concomitant use; possible increased risk of myopathy when fosamprenavir given with simvastatin—avoid concomitant use

Ranolazine: fosamprenavir possibly increases plasma concentration of etravirine—manufacturer of etravirine advises avoid concomitant use

Sildenafil: fosamprenavir possibly increases plasma concentration of sildenafil

Tacrolimus: fosamprenavir increases plasma concentration of tacrolimus

Tadalafil: manufacturer of tadalafil advises avoid concomitant use

Vardenafil: fosamprenavir possibly increases plasma concentration of vardenafil

Fosaprepitant see Aprepitant

Foscarin

Antivirals: avoidance of foscarin advised by manufacturer of lamivudine

Pentamidine isethionate: increased risk of hypocalcaemia when foscarin given with pentamidine isethionate

Fosinopril see ACE Inhibitors

Fosphenytoin see Phenytoin

Framycetin see Aminoglycosides

Frovatriptan see 5HT, Agonists

Furosemide see Diuretics
Fusidic Acid
- Antivirals: plasma concentration of both drugs increased when fusidic acid given with ritonavir—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when fusidic acid given with atorvastatin—increased risk of myopathy when fusidic acid given with simvastatin
- Sugammadex: fusidic acid possibly reduces response to sugammadex
- Vaccines: antibiotics inactivate oral typhoid vaccine—see p. 767

Gabapentin
- Analgesics: bioavailability of gabapentin increased by morphine
- Antacids: absorption of gabapentin reduced by antacids
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with St John’s wort
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by mefloquine
- Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat

Ganciclovir
- Note: Increased risk of myelosuppression with other myelosuppressive drugs—consult product literature
- Valganciclovir interactions as for ganciclovir
- Antivirals: ganciclovir possibly increases plasma concentration of didanosine; avoidance of intravenous ganciclovir advised by manufacturer of lamivudine; profound myelosuppression when ganciclovir given with zidovudine (if possible avoid concomitant administration, particularly during initial ganciclovir therapy)
- Mycophenolate: plasma concentration of ganciclovir possibly increased by mycophenolate, also plasma concentration of inactive metabolite of mycophenolate possibly increased
- Probenecid: excretion of ganciclovir reduced by probenecid (increased plasma concentration and risk of toxicity)
- Tacrolimus: possible increased risk of nephrotoxicity when ganciclovir given with tacrolimus

Gefitinib
- Antivirals: plasma concentration of gefitinib reduced by zidovudine—avoid concomitant use
- Anticoagulants: gefitinib possibly enhances anticoagulant effect of warfarin
- Antidepressants: manufacturer of gefitinib advises avoid concomitant use with St John’s wort
- Antiepileptics: manufacturer of gefitinib advises avoid concomitant use with carbamazepine and phenytoin; cytotoxics possibly reduce absorption of phenytoin
- Antifungals: plasma concentration of gefitinib increased by itraconazole
- Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
- Barbiturates: manufacturer of gefitinib advises avoid concomitant use with barbiturates
- Cardiac Glycosides: cytotoxics reduce absorption of digitoxin tablets
- Ocular-healing Drugs: plasma concentration of gefitinib reduced by manukonidine

Gemcitabine
- Anticoagulants: gemcitabine possibly enhances anticoagulant effect of warfarin
- Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

Gemcitabine (continued)
- Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
- Cardiac Glycosides: cytotoxics reduce absorption of digitoxin tablets

Gemevir
- See Prostaglandins

Gemfibrozil
- See Fibrates

Gentamicin
- See Aminoglycosides

Gestodene
- See Progestogens

Glibenclamide
- See Antidiabetics

Glimepiride
- See Antidiabetics

Glipizide
- See Antidiabetics

Glucosamine
- Anticoagulants: glucosamine enhances anticoagulant effect of warfarin (avoid concomitant use)

Glycerol Trinitrate
- See Nitrates

Glycopyronium
- See Antimuscarinics

Gold
- See Sodium Aurothiomalate

Golimumab
- Abatacept: avoid concomitant use of golimumab with abatacept
- Anakinra: avoid concomitant use of golimumab with anakinra
- Vaccines: avoid concomitant use of golimumab with live vaccines (see p. 746)

Grapefruit Juice
- Anti-arrhythmics: grapefruit juice increases plasma concentration of amiodarone; grapefruit juice possibly increases plasma concentration of dronedarone—avoid concomitant use
- Antihistamines: grapefruit juice increases plasma concentration of efavirenz—avoid concomitant use
- Antimalarials: grapefruit juice possibly increases plasma concentration of artemether/lumefantrine
- Antivirals: grapefruit juice possibly increases plasma concentration of efavirenz
- Anxiolytics and Hypnotics: grapefruit juice increases plasma concentration of buspirone
- Calcium-Channel Blockers: grapefruit juice possibly increases plasma concentration of amiodarone; grapefruit juice possibly increases plasma concentration of verapamil
- Ciclosporin: grapefruit juice increases plasma concentration of ciclosporin (increased risk of toxicity)
- Colchicine: grapefruit juice possibly increases risk of colchicine toxicity
- Cytotoxics: avoidance of grapefruit juice advised by manufacturer of everolimus, lapatinib, milotinib and pazopanib; grapefruit juice possibly increases plasma concentration of vinflunine—manufacturer of vinflunine advises avoid concomitant use
- Labetalol: grapefruit juice increases plasma concentration of labetalol
- Lipid-regulating Drugs: grapefruit juice possibly increases plasma concentration of atorvastatin; grapefruit juice possibly increases plasma concentration of simvastatin—avoid concomitant use
- Ranolazine: grapefruit juice possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: grapefruit juice possibly increases plasma concentration of sildenafil
- Sirolimus: grapefruit juice increases plasma concentration of sirolimus—avoid concomitant use
- Tacrolimus: grapefruit juice increases plasma concentration of tacrolimus
- Tadalafil: grapefruit juice possibly increases plasma concentration of tadalafil
- Tolvaptan: grapefruit juice increases plasma concentration of tolvaptan—avoid concomitant use
- Vardenafil: grapefruit juice possibly increases plasma concentration of vardenafil—avoid concomitant use

Grapefruit Juice (continued)
- Anti-arrhythmics: grapefruit juice possibly increases plasma concentration of amiodarone; grapefruit juice possibly increases plasma concentration of dronedarone
- Anticoagulants: grapefruit juice possibly increases antiocoagulant effect of warfarin—avoid concomitant use
- Antihistamines: grapefruit juice increases plasma concentration of efavirenz
- Antimalarials: grapefruit juice possibly increases plasma concentration of artemether/lumefantrine
- Antivirals: grapefruit juice possibly increases plasma concentration of efavirenz
- Anxiolytics and Hypnotics: grapefruit juice increases plasma concentration of buspirone
- Calcium-Channel Blockers: grapefruit juice possibly increases plasma concentration of amiodarone; grapefruit juice possibly increases plasma concentration of verapamil
- Ciclosporin: grapefruit juice increases plasma concentration of ciclosporin (increased risk of toxicity)
- Colchicine: grapefruit juice possibly increases risk of colchicine toxicity
- Cytotoxics: avoidance of grapefruit juice advised by manufacturer of everolimus, lapatinib, milotinib and pazopanib; grapefruit juice possibly increases plasma concentration of vinflunine—manufacturer of vinflunine advises avoid concomitant use
- Labetalol: grapefruit juice increases plasma concentration of labetalol
- Lipid-regulating Drugs: grapefruit juice possibly increases plasma concentration of atorvastatin; grapefruit juice possibly increases plasma concentration of simvastatin—avoid concomitant use
- Ranolazine: grapefruit juice possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: grapefruit juice possibly increases plasma concentration of sildenafil
- Sirolimus: grapefruit juice increases plasma concentration of sirolimus—avoid concomitant use
- Tacrolimus: grapefruit juice increases plasma concentration of tacrolimus
- Tadalafil: grapefruit juice possibly increases plasma concentration of tadalafil
- Tolvaptan: grapefruit juice increases plasma concentration of tolvaptan—avoid concomitant use
- Vardenafil: grapefruit juice possibly increases plasma concentration of vardenafil—avoid concomitant use
Griseofulvin
Alcohol: griseofulvin possibly enhances effects of alcohol

Anti-congestants: griseofulvin reduces anticoagulant effect of coumarins
Anti-epileptics: absorption of griseofulvin reduced by primidone (reduced effect)
Barbiturates: absorption of griseofulvin reduced by phenobarbital (reduced effect)
Ciclosporin: griseofulvin possibly reduces plasma concentration of ciclosporin
Oestrogens: anecdotal reports of contraceptive failure and menstrual irregularities when griseofulvin given with oestrogens
Progestogens: anecdotal reports of contraceptive failure and menstrual irregularities when griseofulvin given with progestogens
Guanethidine: see Adrenergic Neurone Blockers
Haloperidol: see Antipsychotics
Halothane: see Anaesthetics, General
Heparin: see Heparins
Heparins
ACE Inhibitors: increased risk of hyperkalaemia when heparins given with ACE inhibitors
Alikiren: increased risk of hyperkalaemia when heparins given with alikiren
Analgesics: possible increased risk of bleeding when heparins given with NSAIDs; increased risk of haemorrhage when anticoagulants and antiplatelet agents given with intravenous diclofenac (avoid concomitant use, including low-dose heparin); increased risk of haemorrhage when anticoagulants and antiplatelet agents given with ketorolac (avoid concomitant use, including low-dose heparins); anticoagulant effect of heparins enhanced by aspirin
Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when heparin given with angiotensin-II receptor antagonists
Clopidogrel: increased risk of bleeding when heparins given with clopidogrel
Dipyridamole: anticoagulant effect of heparins enhanced by dipyridamole
Drotrecogin Alfa: avoidance of concomitant use of high doses of heparins with drotrecogin alfa advised by manufacturer of drotrecogin alfa—consult product literature
Hepprost: anticoagulant effect of heparins possibly enhanced by heparprost
Nitrate: anticoagulant effect of heparins reduced by infusions of glyceryl trinitrate
Histamine
Antidepressants: manufacturer of histamine advises avoid concomitant use with MAOIs; effects of histamine theoretically antagonised by tricyclics—manufacturer of histamine advises avoid concomitant use
Antihistamines: effects of histamine theoretically antagonised by antihistamines—manufacturer of histamine advises avoid concomitant use
Antimalarials: manufacturer of histamine advises avoid concomitant use with antimalarials
Antipsychotics: effects of histamine theoretically antagonised by antipsychotics—manufacturer of histamine advises avoid concomitant use
Atovaquone: manufacturer of histamine advises avoid concomitant use with atovaquone
Clonidine: manufacturer of histamine advises avoid concomitant use with clonidine
Corticosteroids: manufacturer of histamine advises avoid concomitant use with corticosteroids
Ulcer-healing Drugs: effects of histamine theoretically antagonised by histamine H₂-antagonists—manufacturer of histamine H₂-antagonists advises avoid concomitant use
Histamine H₂-antagonists
Alpha-blockers: cimetidine and ranitidine antagonised by tolazoline
Analgesics: cimetidine inhibits metabolism of opioid analgesics (increased plasma concentration)
Histamine H₂-antagonists (continued)
Anti-arrhythmics: cimetidine increases plasma concentration of amiodarone and propafenone; cimetidine inhibits metabolism of flecaïnide (increased plasma concentration); cimetidine increases plasma concentration of lidocaine (increased risk of toxicity)
Antibacterials: histamine H₂-antagonists reduce absorption of cefpodoxime; cimetidine increases plasma concentration of erythromycin (increased risk of toxicity, including deafness); cimetidine inhibits metabolism of metronidazole (increased plasma concentration); metabolism of cimetidine accelerated by rifampicin (reduced plasma concentration)
Anti-coagulants: cimetidine inhibits metabolism of coumarins (enhanced anticoagulant effect)
Antidepressants: cimetidine increases plasma concentration of citalopram, escitalopram, mirtrazapine and sertraline; cimetidine inhibits metabolism of amitriptyline, doxepin, imipramine and nortriptyline (increased plasma concentration); cimetidine increases plasma concentration of moclobemide (halve dose of moclobemide); cimetidine possibly increases plasma concentration of tricyclics
Antidiabetics: cimetidine reduces excretion of metformin (increased plasma concentration); cimetidine enhances hypoglycaemic effect of sulfonylureas
Antiepileptics: cimetidine inhibits metabolism of carbamazepine, ethosuximide and valproate (increased plasma concentration)
Antifungals: histamine H₂-antagonists reduce absorption of itraconazole and ketoconazole; avoidance of histamine H₂-antagonists advised by manufacturer of posaconazole (plasma concentration of posaconazole possibly reduced); cimetidine reduces plasma concentration of posaconazole; cimetidine increases plasma concentration of terbinafine
Antihistamines: manufacturer of loratadine advises cimetidine possibly increases plasma concentration of loratadine
Antimalarials: avoidance of cimetidine advised by manufacturer of artemether/lumefantrine; cimetidine inhibits metabolism of chloroquine and hydroxychloroquine and quinine (increased plasma concentration)
Antipsychotics: cimetidine possibly enhances effects of antipsychotics, chlorpromazine and clozapine
Antivirals: histamine H₂-antagonists reduce plasma concentration of zidovudine; histamine H₂-antagonists possibly increase plasma concentration of raltegravir—manufacturer of raltegravir advises avoid concomitant use; cimetidine possibly increases plasma concentration of saquinavir
Anxiolytics and Hypnotics: cimetidine inhibits metabolism of benzodiazepines, clomethiazole and zaleplon (increased plasma concentration); cimetidine increases plasma concentration of melatonin
Beta-blockers: cimetidine increases plasma concentration of labetalol, metoprolol and propranolol (increased plasma concentration)
Calcium-channel Blockers: cimetidine possibly inhibits metabolism of calcium-channel blockers (increased plasma concentration); cimetidine increases plasma concentration of isradipine (halve dose of isradipine)
Ciclosporin: cimetidine possibly increases plasma concentration of ciclosporin
Clonipride: cimetidine possibly reduces antiplatelet effect of clopidogrel
Cytotoxic: cimetidine possibly enhances myelosuppressive effects of carmustine and lomustine; cimetidine increases plasma concentration of cyclosporin; cimetidine inhibits metabolism of fluorouracil (increased plasma concentration); fomatidine possibly reduces plasma concentration of dasatinib; avoidance of cimetidine, fomatidine and naxitine advised by manufacturer of fomitin; ranitidine
Histamine H₂-antagonists

- Cytotoxics (continued)
  - reduces plasma concentration of erlotinib—manufacturer of erlotinib advises at least 2 hours before or 10 hours after ranitidine; ranitidine reduces plasma concentration of gefitinib; histamine H₂-antagonists possibly reduce absorption of lapatinib
  - Ergot Alkaloids: increased risk of ergotism when cimetidine given with ergotamine and methysergide—avoid concomitant use

Histamine: histamine H₂-antagonists theoretically antagonise effects of histamine—manufacturer of histamine advises avoid concomitant use

Hormone Antagonists: absorption of cimetidine possibly delayed by octreotide

5HT, Agonists: cinetidine inhibits metabolism of zolmitriptan (reduce dose of zolmitriptan)

Mebendazole: cimetidine possibly inhibits metabolism of mebendazole (increased plasma concentration)

Roflumilast: cimetidine inhibits the metabolism of roflumilast

Sildenafil: cimetidine increases plasma concentration of sildenafil (consider reducing dose of sildenafil)

Theophylline: cimetidine inhibits metabolism of theophylline (increased plasma concentration)

Thyroid Hormones: cimetidine reduces absorption of levothyroxine

Ulipristal: avoidance of histamine H₂-antagonists advised by manufacturer of ulipristal (plasma concentration of ulipristal possibly reduced)

Homatropine see Antimuscarinics

Hormone Antagonists see Bicalutamide, Danazol, Dutasteride, Exemestane, Flutamide, Lacreotide, Octreotide, Tamoxifen, Toremifene, and Trilostane

5HT₂, Agonists

- Anti-bacterials: plasma concentration of eritriton increased by clarithromycin and erythromycin (risk of toxicity)—avoid concomitant use; metabolism of zolmitriptan possibly inhibited by quinolones (reduce dose of zolmitriptan)

- Antidepressants: increased risk of CNS toxicity when sumatriptan given with eptalopram, escitalopram, fluoxetine, fluvoxamine or paroxetine; metabolism of zolmitriptan possibly inhibited by fluvoxamine; metabolism of zolmitriptan possibly inhibited by fluvoxamine (reduce dose of zolmitriptan); CNS toxicity reported when sumatriptan given with sertraline; possible increased serotoninergic effects when SHT, agonists given with duloxetine or venlafaxine; increased risk of CNS toxicity when zolmitriptan given with MAOIs; risk of CNS toxicity when rizatriptan or sumatriptan given with MAOIs (avoid rizatriptan or sumatriptan for 2 weeks after MAOIs); risk of CNS toxicity when rizatriptan or sumatriptan given with moclobemide (avoid rizatriptan or sumatriptan for 2 weeks after moclobemide); risk of CNS toxicity when zolmitriptan given with moclobemide (reduce dose of zolmitriptan); increased serotoninergic effects when SHT, agonists given with St. John's wort—avoid concomitant use

- Antifungals: plasma concentration of eritriton increased by itraconazole and ketoconazole (risk of toxicity)—avoid concomitant use; plasma concentration of almotriptan increased by ketoconazole (increased risk of toxicity—avoid concomitant use; plasma concentration of almotriptan increased by prapantolol (manufacturer of rizatriptan advises halve dose and avoid within 2 hours of prapantolol)

Dopaminergics: avoidance of SHT, agonists advised by manufacturer of selegiline

5HT₂, Agonists (continued)

- Ergot Alkaloids: increased risk of vasospasm when eletriptan, frovatriptan or naratriptan given with ergotamine and methysergide for 24 hours after eletriptan, frovatriptan or naratriptan, avoid eletriptan, frovatriptan or naratriptan for 24 hours after ergotamine and methysergide; increased risk of vasospasm when almotriptan, rizatriptan, sumatriptan or zolmitriptan given with ergotamine and methysergide (avoid ergotamine and methysergide for 6 hours after almotriptan, rizatriptan, sumatriptan or zolmitriptan, avoid almotriptan, rizatriptan, sumatriptan or zolmitriptan for 24 hours after ergotamine and methysergide)

Lithium: possible risk of toxicity when sumatriptan given with lithium

Ulcer-healing Drugs: metabolism of zolmitriptan inhibited by cimetidine (reduce dose of zolmitriptan)

5HT₂, Antagonists

Analgesics: ondansetron possibly antagonises effects of tramadol

Antibacterials: metabolism of ondansetron accelerated by rifampicin (reduced effect)

Antiepileptics: metabolism of ondansetron accelerated by carbamazepine and phenytoin (reduced effect)

Hydralazine see Vasodilator Antihypertensives

Hydrochlorothiazide see Diuretics

Hydrocortisone see Corticosteroids

Hydroflumethiazide see Diuretics

Hydromorphone see Opioid Analgesics

Hydrodolal see Antacids

Hydroxocobalamin

Antibacterials: response to hydroxocobalamin reduced by chloramphenicol

Hydroxybenzamide

Antiepileptics: cytoxotics possibly reduce absorption of phenytoin

Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)

Antivirals: increased risk of toxicity when hydroxybenzamide given with didanosine and stavudine—avoid concomitant use

Cardiac Glycosides: cytoxotics reduce absorption of digoxin tablets

Hydroxychloroquine see Chloroquine and Hydroxychloroquine

Hydroxyzine see Antihistamines

Hyosine see Antimuscarinics

Ibandronic Acid see Bisphosphonates

Ibufrofen see NSAIDs

Idarubicin

Antiepileptics: cytoxotics possibly reduce absorption of phenytoin

Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytoxotics reduce absorption of digoxin tablets

Ciclosporin: plasma concentration of idarubicin increased by cyclosporin

Ilosulfamate

Anticoagulants: ilosulfamate possibly enhances anti-coagulant effect of coumarins

Antiepileptics: cytoxotics possibly reduce absorption of phenytoin

Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytoxotics reduce absorption of digoxin tablets

Cytotoxicities: increased risk of otoxicity when iodosulfamate given with cisplatin

Ilprost

Analgesics: increased risk of bleeding when ilprost given with NSAIDs or aspirin

Anticoagulants: ilprost possibly enhances anti-coagulant effect of coumarins and heparins;
Iloprost
Anticoagulants (continued)
increased risk of bleeding when iloprost given with phenindione
Clodigorel: increased risk of bleeding when iloprost given with clodigorel
Eptifibatide: increased risk of bleeding when iloprost given with eptifibatide
Tirofiban: increased risk of bleeding when iloprost given with tirofiban
Imatinib
Analgesics: manufacturer of imatinib advises caution with paracetamol
Antibacterials: plasma concentration of imatinib reduced by rifampicin—avoid concomitant use
Anticoagulants: manufacturer of imatinib advises replacement of warfarin with a heparin (possibility of enhanced warfarin effect)
Antidepressants: plasma concentration of imatinib reduced by St John's wort—avoid concomitant use
Antiepileptics: plasma concentration of imatinib reduced by carbamazepine, oxcarbazepine and phenytoin—avoid concomitant use; cytoxotics possibly reduce absorption of phenytoin
Antifungals: imatinib possibly reduces plasma concentration of itraconazole
Antipsychotics: increased by ketocazole
Antipsychotics: avoid concomitant use of cytoxotics with clobazapine (increased risk of agranulocytosis)
Cardiac Glycosides: cytoxotics reduce absorption of digoxin tablets
Ciclosporin: imatinib possibly increases plasma concentration of ciclosporin
Lipid-regulating Drugs: imatinib possibly reduces plasma concentration of levothryroxine
Imidapril see ACE Inhibitors
Imipenem with Cilastatin
Antibacterials: carbapenems reduce plasma concentration of valproate—avoid concomitant use
Antivirals: increased risk of convulsions when imipenem with cilastatin given with ganciclovir
Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 167
Imipramine see Antidepressants, Tricyclic
Immunoglobulins
Note For advice on immunoglobulins and live virus vaccines, see under Normal Immunoglobulin, p. 769
Indacaterol see Sympathomimetics, Beta,
Indapamide see Diuretics
Indinavir
Aldesleukin: plasma concentration of indinavir possibly increased by aldesleukin
Anti-arrhythmics: indinavir possibly increases plasma concentration of amiodarone—avoid concomitant use; indinavir possibly increases plasma concentration of flecainide (increased risk of ventricular arrhythmias—avoid concomitant use)
Antibacterials: indinavir increases plasma concentration of rifabutin—avoid concomitant use; metabolism of indinavir accelerated by rifampicin (reduced plasma concentration—avoid concomitant use); avoidance of concomitant indinavir in severe renal and hepatic impairment advised by manufacturer of efalimumab
Anticoagulants: avoidance of indinavir advised by manufacturer of rivaroxaban
Antidepressants: plasma concentration of indinavir reduced by St John's wort—avoid concomitant use
Antiepileptics: plasma concentration of indinavir possibly reduced by carbamazepine and phenytoin, also plasma concentration of carbamazepine and phenytoin possibly increased; plasma concentration of indinavir possibly reduced by primidone
Antifungals: plasma concentration of indinavir increased byitraconazole and ketoconazole (consider reducing dose of indinavir)
Antimalarials: caution with indinavir advised by manufacturer of artesunate/lumefantrine; indinavir possibly increases plasma concentration of quinine (increased risk of toxicity)
Antimuscarnicains: avoidance of indinavir advised by manufacturer of darifenacin and tolterodine; manufacturer of fesoterodine advises dose reduction when indinavir given with fesoterodine—consult fesoterodine product literature
Antipsychotics: indinavir possibly inhibits metabolism of aripiprazole (reduce dose of aripiprazole); indinavir possibly increases plasma concentration of pinozide (increased risk of ventricular arrhythmias—avoid concomitant use)
Antivirals: avoid concomitant use of indinavir with abacavir; plasma concentration of both drugs increased when indinavir given with darunavir; plasma concentration of indinavir reduced by efavirenz and nevirapine; plasma concentration of indinavir possibly reduced by etravirine—avoid concomitant use; indinavir increases plasma concentration of maraviroc (consider reducing dose of maraviroc); combination of indinavir with nelfinavir may increase plasma concentration of either drug (or both); plasma concentration of indinavir increased by ritonavir; indinavir increases plasma concentration of saquinavir
Anxiolytics and Hypnotics: increased risk of prolonged sedation when indinavir given with alprazolam—avoid concomitant use; indinavir possibly increases plasma concentration of midazolam (risk of prolonged sedation—avoid concomitant use of oral midazolam)
Atovalozone: plasma concentration of indinavir possibly reduced by atovaquone
Barbiturates: plasma concentration of indinavir possibly reduced by barbiturates; plasma concentration of indinavir possibly reduced by phenobarbital, also plasma concentration of phenobarbital possibly increased
Ciclosporin: indinavir increases plasma concentration of ciclosporin
Colchicine: indinavir possibly increases risk of colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
Corticosteroids: plasma concentration of indinavir possibly reduced by dexamethasone
Cytotoxics: indinavir possibly increases plasma concentration of everolimus—manufacturer of everolimus advises avoid concomitant use; avoidance of indinavir advised by manufacturer of pazopanib
Ergot Alkaloids: increased risk of ergotism when indinavir given with ergotamine and methysergide—avoid concomitant use
5HT, Agonists: indinavir increases plasma concentration of ketotifen (risk of toxicity)—avoid concomitant use
Lipid-regulating Drugs: possible increased risk of myopathy when indinavir given with atorvastatin; possible increased risk of myopathy when indinavir given with rosuvastatin—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when indinavir given with simvastatin (avoid concomitant use)
Ranolazine: indinavir possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use
Sildenafil: indinavir increases plasma concentration of sildenafil—reduce initial dose of sildenafil
Tamafafil: indinavir possibly increases plasma concentration of tadalafil
Vardenafil: indinavir increases plasma concentration of vardenafil—avoid concomitant use
Indometacin see NSAIDs
Indoramin see Alpha-blockers
**Infliximab**
- Abatacept: avoid concomitant use of infliximab with abatacept
- Anakinra: avoid concomitant use of infliximab with anakinra
- Vaccines: avoid concomitant use of infliximab with live vaccines (see p. 746)

**Influenza Vaccine** see Vaccines

**Insulin** see Antidiabetics

**Interferon Alfa** see Interferons

**Interferon Gamma** see Interferons

**Interferons**
- Note: Peginterferon alfa interactions as for interferon alfa
- Antivirals: increased risk of peripheral neuropathy when interferon alfa given with telbivudine
- **Theophylline**: interferon alfa inhibits metabolism of theophylline (consider reducing dose of theophylline)
- Vaccines: manufacturer of interferon gamma advises avoid concomitant use with vaccines

**Ipratropium** see Antimuscarinics

**Ibzeran** see Angiotensin-II Receptor Antagonists

**Irinotecan**
- Anti-depressants: metabolism of irinotecan accelerated by St John's wort (reduced plasma concentration—avoid concomitant use)
- Antiepileptics: plasma concentration of irinotecan and its active metabolite reduced by carbamazepine and phenytoin; cytoxotixs possibly reduce absorption of phenytoin
- Anti-fungals: plasma concentration of irinotecan reduced by ketoconazole (but concentration of irinotecan increased)—avoid concomitant use
- Anti-psychotics: avoid concomitant use of cytoxotixs with clozapine (increased risk of agranulocytosis)
- Antivirals: metabolism of irinotecan possibly inhibited by azathoprine (increased risk of toxicity)
- Barbiturates: plasma concentration of irinotecan and its active metabolite reduced by phenobarbital
- Cardiac Glycosides: cytoxotixs reduce absorption of digoxin tablets
- **Cytotoxix**: plasma concentration of active metabolite of irinotecan increased by lapatinib—consider reducing dose of irinotecan; plasma concentration of irinotecan possibly increased by soralenib

**Iron**
- Antacids: absorption of oral iron reduced by oral magnesium salts (as magnesium trisilicate)
- Antibacterials: oral iron reduces absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin; oral iron reduces absorption of tetracyclines, also absorption of oral iron reduced by tetracyclines
- Bisphosphonates: oral iron reduces absorption of bisphosphonates
- Calcium Salts: absorption of oral iron reduced by calcium salts
- Dimercaprol: avoid concomitant use of iron with dimercaprol
- Dapominicergics: oral iron reduces absorption of entacapone; oral iron possibly reduces absorption of levodopa
- Etroombopag: oral iron possibly reduces absorption of etroombopag (give at least 4 hours apart)
- Methyldopa: oral iron antagonises hypotensive effect of methyldopa
- Mycohenolate: oral iron reduces absorption of mycohenolate
- Penicillin: oral iron reduces absorption of penicillin
- Thyroid Hormones: oral iron reduces absorption of levothyroxine (give at least 2 hours apart)
- Trientine: absorption of oral iron reduced by trientine
- Zinc: oral iron reduces absorption of zinc, also absorption of oral iron reduced by zinc

**Isocarboxazid** see MAOIs

**Isopropylurane** see Anaesthetics, General

**Isometheptene** see Sympathomimetics

**Isoniazid**
- Antacids: absorption of isoniazid reduced by antacids
- Antibacterials: increased risk of CNS toxicity when isoniazid given with cycloserine
- **Antiepileptics**: isoniazid increases plasma concentration of carbamazepine (also possibly increased isoniazid hepatotoxicity); isoniazid inhibits metabolism of ethinyl oestradiol (reduced plasma concentration and risk of toxicity); isoniazid possibly inhibits metabolism of phenytoin (increased risk of toxicity)
- Antifungals: isoniazid possibly reduces plasma concentration of ketoconazole
- Antihistametics and Hypnotics: isoniazid inhibits the metabolism of diazepam
- Corticosteroids: plasma concentration of isoniazid possibly reduced by corticosteroids
- Disulfiram: isoniazid possibly increases CNS effects of disulfiram
- Dopaminergics: isoniazid possibly reduces effects of levodopa
- **Theophylline**: isoniazid possibly increases plasma concentration of theophylline

**Vaccines**: isoniazid possibly reduces effects of oral vaccines—see p. 767

**Isosorbide Dinitrate** see Nitrates

**Isosorbide Mononitrate** see Nitrates

**Istretinoin** see Retinoids

**Ivatadrine**
- Anti-arrhythmics: increased risk of ventricular arrhythmias when ivabradine given with amiodarone or disopyramide
- Antibacterials: plasma concentration of ivabradine possibly increased by barbiturates and telithromycin—avoid concomitant use
- Antidepressants: plasma concentration of ivabradine reduced by St John's wort—avoid concomitant use
- Anti-fungals: plasma concentration of ivabradine increased by ketoconazole—avoid concomitant use; plasma concentration of ivabradine increased by fluconazole—reduce initial dose of ivabradine; plasma concentration of ivabradine possibly increased byitraconazole—avoid concomitant use
- Anti-imalarial: increased risk of ventricular arrhythmias when ivabradine given with mephalone
- Antipsychotics: increased risk of ventricular arrhythmias when ivabradine given with phenothiazines
- Antivirals: plasma concentration of ivabradine possibly increased by nelfiltravir and ritonavir—avoid concomitant use
- Beta-blockers: increased risk of ventricular arrhythmias when ivabradine given with sotalol
- Calcium-channel Blockers: plasma concentration of ivabradine increased by diltiazem and verapamil—avoid concomitant use
- Grapefruit Juice: plasma concentration of ivabradine increased by grapefruit juice
- Pentamidine isethionate: increased risk of ventricular arrhythmias when ivabradine given with pentamidine isethionate

**Iveolin**
- Analgesics: kaolin possibly reduces absorption of aspirin
- Antibacterials: kaolin possibly reduces absorption of tetracyclines
- Anti-imalaria: ivadoline reduces absorption of chloroquine and hydroxychloroquine
- Antipsychotics: kaolin possibly reduces absorption of phenothiazines

**Ketamine** see Anaesthetics, General

**Ketorozole** see Antifungals, Imidazoles

**Ketoprofen** see NSAIDs

**Ketorolac** see NSAIDs
Ketotifen see Antihistamines
Labetalol see Beta-blockers
Lacidipine see Calcium-channel Blockers
Lacosamide
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SIRIs and tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with St John’s wort
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by neftoquine
- Orlistat: possible increased risk of convulsions when antiepileptics given with erlotistat
Lactulose
- Anticoagulants: lactulose possibly enhances anticoagulant effect of coumarins
Lamivudine
- Antimicrobials: plasma concentration of lamivudine increased by trimethoprim (as co-trimoxazole)—avoid concomitant use of high-dose co-trimoxazole
- Antivirals: avoidance of lamivudine advised by manufacturer of emtricitabine; manufacturer of lamivudine advises avoidance of concomitant use with foscamet; manufacturer of lamivudine advises avoid concomitant use of intravenous ganciclovir
Lamotrigin
- Antimicrobials: plasma concentration of lamotrigin reduced by trimampicin
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SIRIs and tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with St John’s wort
- Antiepileptics: plasma concentration of lamotrigin often reduced by carbamazepine, also plasma concentration of an active metabolite of carbamazepine sometimes raised (but evidence is conflicting); plasma concentration of lamotrigin reduced by phenobarbital; plasma concentration of lamotrigin increased by valproate
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by neftoquine
- Antivirals: plasma concentration of lamotrigin possibly reduced by ritonavir
Barbiturates: plasma concentration of lamotrigin reduced by phenobarbital
- Oestrogens: plasma concentration of lamotrigin reduced by oestrogens—consider increasing dose of lamotrigin
- Oestrogens: possible increased risk of convulsions when antiepileptics given with erlotistat
Progestagens: plasma concentration of lamotrigin possibly increased by desogestrel
Lanreotide
- Antidepressants: lanreotide possibly reduces requirements for insulin, metformin, repaglinide and sulfonylureas
- Ciclosporin: lanreotide reduces plasma concentration of ciclosporin
Lansoprazole see Proton Pump Inhibitors
Lanthanum
- Antitoxics: lanthanum possibly reduces absorption of quinolones (give at least 2 hours before or 4 hours after lanthanum)
- Antifungals: lanthanum possibly reduces absorption of ketoconazole (give at least 2 hours apart)
- Antimalarials: lanthanum possibly reduces absorption of chloroquine and hydroxychloroquine (give at least 2 hours apart)
- Lanreotide: manufacturer of lanreotide advises avoid concomitant use with rifabutin, rifampicin and telithromycin
- Antidepressants: manufacturer of lanreotide advises avoid concomitant use with St John’s wort
- Antidiabetics: manufacturer of lanreotide advises avoid concomitant use with repaglinide
- Antiepileptics: plasma concentration of lanreotide reduced by carbamazepine—avoid concomitant use; cytotoxics possibly reduce absorption of phenytoin; manufacturer of lanreotide advises avoid concomitant use with phenytoin
- Antifungal: plasma concentration of lanreotide increased by ketoconazole—avoid concomitant use; manufacturer of lanreotide advises avoid concomitant use with itraconazole, posaconazole and voriconazole
- Antipsychotics: avoid concomitant use of cytoxoties with clozapine (increased risk of agranulocytosis); manufacturer of lanreotide advises avoid concomitant use with pimozide
- Antivirals: manufacturer of lanreotide advises avoid concomitant use with itaconazole, posaconazole and voriconazole
Cardiac Glycosides: cytoxoties reduce absorption of digoxin tablets
- Anticoagulants: manufacturer of lanreotide advises avoid concomitant use with grapefruit juice
- Ulcer-healing Drugs: absorption of lanreotide possibly reduced by histamine H2-antagonists and proton pump inhibitors
Laronidase
- Antimalarials: effects of laronidase possibly inhibited by chloroquine and hydroxychloroquine (manufacturer of laronidase advises avoid concomitant use)
Leukotriene Receptor Antagonists (continued)  
Barbiturates: plasma concentration of montelukast reduced by phenobarbital 
Theophylline: zafirlukast possibly increases plasma concentration of theophylline, also plasma concentration of zafirlukast reduced

Levamisole  
Alcohol: possibility of diazepam-like reaction when levamisole given with alcohol 
Anticoagulants: levamisole possibly enhances anticoagulant effect of warfarin 
Antiepileptics: levamisole possibly increases plasma concentration of phenytoin

Levetiracetam  
Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSris and tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with St John’s wort 
Antiepileptics: levetiracetam possibly increases risk of carbamazepine toxicity

Antimalarias: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of anti-epileptics antagonised by methotrexate 
Orilast: possible increased risk of convulsions when antiepileptics given with orlistat

Levobunolol see Beta-blockers  
Levobupivacaine  
Anti-arrhythmics: increased myocardial depression when levobupivacaine given with anti-arrhythmics  
Levocetirizine see Antihistamines  
Levodopa  
ACE Inhibitors: enhanced hypotensive effect when levodopa given with ACE inhibitors 
Adrenergic Neurone Blockers: enhanced hypotensive effect when levodopa given with adrenergic neurone blockers 
Alpha-blockers: enhanced hypotensive effect when levodopa given with alpha-blockers 
Antidepressants: risk of hypertensive crisis when levodopa given with isoniazid 
Antimuscarinics: absorption of levodopa possibly reduced by antimuscarinics  
Antipsychotics: effects of levodopa possibly reduced by antipsychotics  
Antivirals: plasma concentration of lido- 
 
Levodopa (continued)  
Dopaminergics: enhanced effects and increased toxicity of levodopa when given with selegiline (reduce dose of levodopa) 
Iron: absorption of levodopa possibly reduced by oral iron 
Memantine: effects of dopaminergics possibly enhanced by memantine 
Methyldopa: enhanced hypotensive effect when levodopa given with methyldopa; antiparkinsonian effect of dopaminergics antagonised by methyldopa 
Moxonidine: enhanced hypotensive effect when levodopa given with moxonidine 
Muscle Relaxants: possible agitation, confusion and hallucinations when levodopa given with baclofen 
Nitrates: enhanced hypotensive effect when levodopa given with nitrates 
Vasodilator Antihypertensives: enhanced hypotensive effect when levodopa given with hydralazine, minoxidil or sodium nitroprusside 
Vitamins: effects of levodopa reduced by pyridoxine when given with dopa-decarboxylase inhibitor 

Levofloxacin see Quinolones  
Levofolic Acid see Folicates  
Levomepromazine see Antipsychotics  
Levonorgestrel see Progestogens  
Levothyroxine see Thyroid Hormones  
Lidocaine Note  
Interactions less likely when lidocaine used topically

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine  
Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other anti-arrhythmics

Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with antipsychotics that prolong the QT interval

Antivirals: plasma concentration of lidocaine possibly increased by atazanavir and lopinavir; plasma concentration of lidocaine possibly increased by darunavir and fosamprenavir—avoid concomitant use; increased risk of ventricular arrhythmias when lidocaine given with saquinavir—avoid concomitant use

Beta-blockers: increased myocardial depression when anti-arrhythmics given with beta-blockers; increased risk of lidocaine toxicity when given with propranolol

Diuretics: action of lidocaine antagonised by hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics

Muscle Relaxants: neuromuscular blockade enhanced and prolonged when lidocaine given with suxamethonium

Uler-healing Drugs: plasma concentration of lidocaine increased by cimetidine (increased risk of toxicity)

Linezolid Note  
Linezolid is a reversible, non-selective MAO inhibitor—see interactions of MAOIs

Antibacterial: plasma concentration of linezolid reduced by rifampicin (possible therapeutic failure of linezolid)

Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 767

Liothyronine see Thyroid Hormones  
Lipid-regulating Drugs see Colestipol, Colestymarine, Ezetimibe, Fibrates, Nicotinic Acid, and Statins  
Liraglutide see Antidiabetics  
Lisinopril see ACE Inhibitors  
Lithium  
ACE Inhibitors: excretion of lithium reduced by ACE inhibitors (increased plasma concentration)

Analgesics: excretion of lithium reduced by NSAIDs (increased risk of toxicity); excretion of lithium reduced by non-steroidal anti-inflammatory drugs

Note  
Linezolid is a reversible, non-selective MAO inhibitor—see interactions of MAOIs
Appendix 1: Interactions

**Lopinavir**

Note: In combination with ritonavir as Kaletra® (ritonavir is present to inhibit lopinavir metabolism and increase plasma-lopinavir concentration)—see also Ritonavir

- Anti-arrhythmics: lopinavir possibly increases plasma concentration of efavirenz (increased risk of ventricular arrhythmias)—avoid concomitant use; lopinavir possibly increases plasma concentration of lidocaine
- Antibacterials: plasma concentration of lopinavir reduced by rifampicin—avoid concomitant use; avoidance of concomitant lopinavir in severe renal and hepatic impairment advised by manufacturer of etrolithromycin
- Anticoagulants: avoidance of lopinavir advised by manufacturer of rivaroxaban
- Antidepressants: plasma concentration of lopinavir possibly reduced by carbamazepine, phenytoin and primidone
- Angiotensin-II Receptor Antagonists: plasma concentration of lopinavir reduced by St John’s wort—avoid concomitant use
- Antiepileptics: plasma concentration of lopinavir possibly reduced by carbamazepine, phenytoin and primidone
- Antihistamines: lopinavir possibly increases plasma concentration of chlorphenamine
- Antimalarials: caution with lopinavir advised by manufacturer of arteether/lumefantrine
- Antivirals: avoidance of lopinavir advised by manufacturer of darifenacin and tolterodine
- Anxiolytics and Hypnotics: lopinavir possibly inhibits metabolism of alprazolam (reduce dose of alprazolam)
- Calcium-channel Blockers: neurotoxicity may occur when lopinavir given with diltiazem or verapamil without increased plasma concentration of lithium
- Cytotoxics: increased risk of ventricular arrhythmias when lopinavir given with warfarin
- Diuretics: increased risk of toxicity when lopinavir given with olsalazine; increased risk of extrapyramidal side-effects when lopinavir given with sulpiride
- Antipsychotics: increased risk of extrapyramidal side-effects and possibly neurotoxicity when lopinavir given with clozapine, fluoxetine, haloperidol, phenothiazines or zuclopenthixol; possible risk of toxicity when lopinavir given with olanzapine; increased risk of extrapyramidal side-effects when lopinavir given with sulpiride
- Antidepressants, Tricyclic: increased risk of neurotoxicity when lopinavir given with clonazepam
- Calcium-channel Blockers: neurotoxicity may occur when lopinavir given with diltiazem or verapamil without increased plasma concentration of lithium
- Diuretics: increased risk of toxicity when lopinavir given with amiloride; increased risk of toxicity by loop diuretics and thiazides and related diuretics (increased plasma concentration and risk of toxicity)—loop diuretics safer than thiazides; increased risk of lithium reduced by potassium-sparing diuretics and aldosterone antagonists (increased plasma concentration and risk of toxicity)
- ACE inhibitors: possible risk of toxicity when lopinavir given with sumatriptan
- Methyldopa: neurotoxicity may occur when lopinavir given with methyldopa without increased plasma concentration of lithium
- Muscle Relaxants: increased risk of muscle relaxation; hyperkinesia caused by lithium possibly aggravated by baclofen
- Parasympathomimetics: lithium antagonises effects of neostigmine and pyridostigmine
- Theophylline: increased risk of toxicity by lopinavir given with sumatriptan
- Barbiturates: plasma concentration of lopinavir possibly reduced by phenobarbital
- Corticosteroids: plasma concentration of lopinavir possibly reduced by dexamethasone
- Eltrombopag: lopinavir possibly reduces plasma concentration of eltrombopag
- Lipoic acid (reduced risk of myopathy when lopinavir given with atorvastatin; possible increased risk of myopathy when lopinavir given with rosuvastatin—manufacturer of rosuvastatin advises avoid concomitant use; possible increased risk of myopathy when lopinavir given with simvastatin—avoid concomitant use)
- Ranolazine: lopinavir possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Sirtolimus: lopinavir possibly increases plasma concentration of sirolimus
- Loprazolam see Anxiolytics and Hypnotics
- Loratadine see Antihistamines
- Lorazepam see Anxiolytics and Hypnotics
- Lormetazepam see Anxiolytics and Hypnotics
- Losartan see Angiotensin-II Receptor Antagonists
- Lumeefantrine see Artemether with Lumefantrine
- Lymecycline see Tetracyclines
Macrolides

Note  See also Telithromycin

Note Interactions do not apply to small amounts of erythromycin used topically

Analgesics: erythromycin increases plasma concentration of alfentanil

Antacids: absorption of azithromycin reduced by antacids

- Antiarrhythmics: increased risk of ventricular arrhythmias when parenteral erythromycin given with amiodarone—avoid concomitant use; erythromycin increases plasma concentration of disopyramide (increased risk of toxicity); clarithromycin possibly increases plasma concentration of disopyramide (increased risk of toxicity); erythromycin possibly increases plasma concentration of dronedarone (increased risk of ventricular arrhythmias—avoid concomitant use); avoidance of clarithromycin advised by manufacturer of dronedarone (risk of ventricular arrhythmias)

- Antibacterials: increased risk of ventricular arrhythmias when parenteral erythromycin given with moxifloxacin—avoid concomitant use; macrolides possibly increase plasma concentration of rifabutin (increased risk of uveitis—reduce rifabutin dose); clarithromycin increases plasma concentration of rifabutin (increased risk of uveitis—reduce rifabutin dose); plasma concentration of clarithromycin reduced by rifampin

- Anticoagulants: clarithromycin and erythromycin enhance anticoagulant effect of coumarins; azithromycin possibly enhances anticoagulant effect of coumarins

- Antidepressants: avoidance of macrolides advised by manufacturer of reboxetine

Antidiabetics: clarithromycin enhances effects of repaglinide

- Antiepileptics: clarithromycin and erythromycin increase plasma concentration of carbamazepine; clarithromycin inhibits metabolism of phenytoin (increased plasma concentration); erythromycin possibly inhibits metabolism of valproate (increased plasma concentration)

Antifungals: clarithromycin increases plasma concentration of itraconazole

- Antihistamines: manufacturer of loratadine advises erythromycin possibly increases plasma concentration of loratadine; macrolides possibly inhibit metabolism of eminolastine (avoid concomitant use); erythromycin inhibits metabolism of minolastine—avoid concomitant use; erythromycin increases plasma concentration of rupatadine

- Antimalarials: avoidance of macrolides advised by manufacturer of artether/lumefantrine

Antimuscarinics: erythromycin possibly increases plasma concentration of dantefacin; manufacturer of fosoterodine advises dose reduction when clarithromycin given with fosoterodine—consult fosoterodine product literature; avoidance of clarithromycin and erythromycin advised by manufacturer of tolterodine

- Antipsychotics: avoidance of macrolides advised by manufacturer of droperidol (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when parenteral erythromycin given with moclubenthrin—avoid concomitant use; increased risk of ventricular arrhythmias when erythromycin given with simrilupride—avoid concomitant use; erythromycin possibly increases plasma concentration of econazole; increased risk of ventricular arrhythmias when erythromycin given with ipimidine—avoid concomitant use; macrolides possibly increase plasma concentration of quetiapine (reduce dose of quetiapine); increased risk of ventricular arrhythmias when parenteral erythromycin given with sulpiride

Macrolides (continued)

- Antivirals: plasma concentration of both drugs increased when clarithromycin given with atazanavir; increased risk of rash when clarithromycin given with efavirenz; clarithromycin increases plasma concentration of etravirine, also plasma concentration of clarithromycin reduced; clarithromycin possibly increases plasma concentration of maraviroc (consider reducing dose of maraviroc); plasma concentration of clarithromycin reduced by nevirapine (but concentration of an active metabolite increased), also plasma concentration of nevirapine increased; plasma concentration of clarithromycin increased by ritonavir (reduce dose of clarithromycin in renal impairment); plasma concentration of azithromycin and erythromycin possibly increased by ritonavir; increased risk of ventricular arrhythmias when clarithromycin or erythromycin given with saquinavir—avoid concomitant use; plasma concentration of clarithromycin increased by etravirine (reduce dose of clarithromycin in renal impairment), also clarithromycin increases plasma concentration of tipranavir; clarithromycin tablets reduce absorption of zidovudine (give at least 2 hours apart)

- Antiulcer and Hypnotics: clarithromycin and erythromycin inhibit metabolism of midazolam (increased plasma concentration with increased sedation); erythromycin increases plasma concentration of buspirone (reduce dose of buspirone); erythromycin inhibits the metabolism of zopiclone (increased risk of toxicity); aprepitant: clarithromycin possibly increases plasma concentration of aprepitant

- Antidepressants: increased risk of ventricular arrhythmias when parenteral erythromycin given with atomoxetine

- Calcium-channel Blockers: erythromycin possibly inhibits metabolism of felodipine (increased plasma concentration); avoidance of erythromycin advised by manufacturer of lercanidipine; clarithromycin and erythromycin possibly inhibit metabolism of verapamil (increased risk of toxicity)

- Cardiac Glycosides: macrolides increase plasma concentration of digoxin (increased risk of toxicity)

- Ciclosporin: macrolides possibly inhibit metabolism of ciclosporin (increased plasma concentration); clarithromycin and erythromycin inhibit metabolism of ciclosporin (increased plasma concentration)

- Clopidogrel: erythromycin possibly reduces antiplatelet effect of clopidogrel

- Colchicine: azithromycin, clarithromycin and erythromycin possibly increase risk of colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)

- Corticosteroids: erythromycin possibly inhibits metabolism of corticosteroids; erythromycin inhibits the metabolism of methylprednisolone; clarithromycin possibly increases plasma concentration of methylprednisolone

- Cytoprotection: clarithromycin possibly increases plasma concentration of everolimus—manufacturer of everolimus advises avoid concomitant use; erythromycin increases plasma concentration of everolimus; avoidance of clarithromycin advised by manufacturer of nilotinib and pazopanib; in vitro studies suggest a possible interaction between erythromycin and docetaxel (consult docetaxel product literature); increased risk of ventricular arrhythmias when erythromycin given with arsenic trioxide; erythromycin increases toxicity of vinblastine—avoid concomitant use; possible increased risk of neutropenia when clarithromycin given with vinorelbine

- Diuretics: clarithromycin increases plasma concentration of spironolactone—avoid concomitant use;
Appendix 1: Interactions

BNF 61

Macrolides
- Diuretics (continued)
  - erythromycin increases plasma concentration of
  - Dopaaminergics: macrolides possibly increase plasma concentration of bromocriptine and cabergoline (increased risk of toxicity); erythromycin increases plasma concentration of bromocriptine and cabergoline (increased risk of toxicity)
- Ergot Alkaloids: increased risk of ergotism when macrolides given with ergotamine and methysergide—avoid concomitant use
- SHT, Agonists: clarithromycin and erythromycin increase plasma concentration of ketorolac (risk of toxicity)—avoid concomitant use
- Ivabradine: clarithromycin possibly increases plasma concentration of silibradine—avoid concomitant use
- Leukotriene Receptor Antagonists: erythromycin reduces plasma concentration of zafirlukast
- Lipid-regulating Drugs: clarithromycin increases plasma concentration of atorvastatin and pravastatin; possible increased risk of myopathy when erythromycin given with atorvastatin; erythromycin increases plasma concentration of pravastatin; erythromycin reduces plasma concentration of rosuvastatin; increased risk of myopathy when clarithromycin or erythromycin given with pravastatin (avoid concomitant use
- Parasympathomimetics: erythromycin increases plasma concentration of galantamine
- Pentamidine isetionate: increased risk of ventricular arrhythmias when parenteral erythromycin given with pentamidine isetionate
- Ranolazine: clarithromycin possibly increases plasma concentration of ranolazine. Manufacturerm of ranolazine advises avoid concomitant use
- Sildenafil: clarithromycin increases plasma concentration of sildenafil—reduce dose of sildenafil
- Sirolimus: clarithromycin increases plasma concentration of sirolimus—avoid concomitant use
- Tadalafil: increase plasma concentration of tadalafil
- Tadalafil: clarithromycin and erythromycin increase plasma concentration of tacrolimus
- Tadalafil: clarithromycin and erythromycin possibly increase plasma concentration of tadalafil
- Theophylline: azithromycin possibly increases plasma concentration of theophylline; clarithromycin inhibits metabolism of theophylline (increased plasma concentration); erythromycin inhibits metabolism of theophylline (increased plasma concentration), if erythromycin given by mouth, also decreased plasma-erythromycin concentration
- Ulcer-healing Drugs: plasma concentration of erythromycin increased by cimetidine (increased risk of toxicity, including deafness); plasma concentration of both drugs increased when clarithromycin given with omeprazole
- Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 767
- Vardenafil: erythromycin increases plasma concentration of vardenafil (reduce dose of vardenafil)

Magnesium (parenteral)
- Calcium-channel Blockers: profound hypotension reported with concomitant use of parenteral magnesium and nifedipine in pre-eclampsia
- Muscle Relaxants: parenteral magnesium enhances effects of non-depolarising muscle relaxants and suxamethonium

Magnesium Salts (oral) see Antacids

Mannitol
- Ciclosporin: possible increased risk of nephrotoxicity when mannitol given with ciclosporin

MAOIs
- Note For interactions of reversible MAO-A inhibitors (RIMAs) see Moclobemide, and for interactions of MAO-B inhibitors see Rasagiline and Selegiline; the antibacterial Linezolid is a reversible, non-selective MAO inhibitor
- ACE Inhibitors: MAOIs possibly enhance hypnotic effect of ACE inhibitors
- Adrenergic Neurone Blockers: enhanced hypnotic effect when MAOIs given with adrenergic neurone blockers
- Alcohol: MAOIs interact with tyramine found in some beverages containing alcohol and some dealcoholised beverages (hypertensive crisis)—if no tyramine, enhanced hypnotic effect
- Alpha-2-Adrenoceptor Stimulants: avoidance of MAOIs advised by manufacturer of apraclonidine and brimonidine
- Alpha-blockers: avoidance of MAOIs advised by manufacturer of; enhanced hypnotic effect when MAOIs are given with alpha-blockers
- Analgesics: CNS excitation or depression (hypertension or hypotension) when MAOIs given with
- clonidine—avoid concomitant use and for 2 weeks after stopping MAOIs; possible increased sedation effects and increased risk of convulsions when MAOIs given with tranylcypromine; some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; avoidance of MAOIs advised by manufacturer of nefazodone; possible CNS excitation or depression (hypertension or hypotension) when MAOIs given with—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs
- Angiotensin-II Receptor Antagonists: MAOIs possibly enhance hypnotic effect of angiotensin-II receptor antagonists
- Antidepressants: increased risk of hypertension and CNS excitation when MAOIs given with
- Reboxetine (MAOIs should not be started until 1 week after stopping reboxetine, avoid reboxetine for 2 weeks after stopping MAOIs); after stopping MAOIs do not start;
- Sertraline; after stopping MAOIs do not start
- Venlafaxine—increased risk of hypertension and CNS excitation when MAOIs given with
- Serotonin reuptake inhibitors (SSRIs (risk of serotonin toxicity); after stopping MAOIs do not start
- Venlafaxine; after stopping MAOIs do not start
- Duloxetine for 2 weeks, also MAOIs should not be started until at least 5 days after stopping duloxetine; enhanced CNS effects and toxicity when MAOIs given with venlafaxine (venlafaxine should not be started until at least 2 weeks after stopping venlafaxine), increased risk of hypertension and CNS excitation when MAOIs given with other MAOIs (avoid for at least 2 weeks after stopping previous MAOIs and then start at a reduced dose), after stopping MAOIs do not start
- Mirtazapine for 2 weeks, also MAOIs should not be started until at least 2 weeks after stopping mirtazapine; increased CNS effects of an SSRI (risk of serious toxicity); after stopping MAOIs do not start
- Nortriptyline for 2 weeks, also MAOIs should not be started until at least 2 weeks after stopping nortriptyline; after stopping MAOIs do not start
- Venlafaxine; after stopping MAOIs do not start
- Tricyclic-related antidepressants for 2 weeks, also MAOIs should not be started until at least 1–2 weeks after stopping tricyclic-related antidepressants; increased risk of hypertension and CNS excitation when MAOIs given with tetracyclines, tricyclics should not be started until 2 weeks after stopping MAOIs (3 weeks if clomipramine or imipramine), also MAOIs should not be started for at least 1–2 weeks after stopping tricyclics (3 weeks in the case of clomipramine or imipramine); CNS excitation and confusion when MAOIs given with tryptophan (reduce dose of tryptophan)
Appendix 1: Interactions

MAOIs (continued)

Antidiabetics: MAOIs possibly enhance hypoglycaemic effect of antidiabetics; MAOIs enhance hypoglycaemic effect of insulin, metformin and sulfonylurées.

- Antiepileptics: MAOIs possibly antagonise antiepileptic (convulsive threshold lowered); avoidance for 2 weeks after stopping MAOIs advised by manufacturer of carbamazepine, also antagonism of anticonvulsant effect.

Antihistamines: increased anantimuraria and sedative effects when MAOIs given with antihistamines.

- Antimalarials: avoidance of antidepressants advised by manufacturer of artemether/lumefantrine.

- Antimuscarinics: increased risk of antimuscarinic side-effects when MAOIs given with antimuscarinics.

- Antipsychotics: CNS effects of MAOIs possibly increased by clozapine.

Antidepressants and Antipsychotics: avoidance of MAOIs advised by manufacturer of buspirone; manufacturer of tranylcypromine advises buspirone for 10 days after stopping tranylcypromine.

- Atomoxetine: avoidance of antidepressants advised by manufacturer of atomoxetine for 2 weeks, also MAOIs should not be started until at least 2 weeks after stopping atomoxetine; possible increase of convulsions when antidepressants given with atomoxetine.

Barbiturates: MAOIs possibly antagonise anticonvulsant effect of barbiturates (convulsive threshold lowered).

Beta-blockers: enhanced hypotensive effect when MAOIs given with beta-blockers.

- Bupropion: avoidance of bupropion for 2 weeks after stopping MAOIs advised by manufacturer of bupropion.

Calcium-channel Blockers: enhanced hypotensive effect when MAOIs given with calcium-channel blockers.

Clonidine: enhanced hypotensive effect when MAOIs given with clonidine.

Diazoxide: enhanced hypotensive effect when MAOIs given with diazoxide.

Diuretics: enhanced hypotensive effect when MAOIs given with diuretics.

- Dopaminergics: avoid concomitant use of non-selective MAOIs with entacapone; risk of hypertensive crisis when MAOIs given with levodopa, avoid levodopa for at least 2 weeks after stopping MAOIs; risk of hypertensive crisis when MAOIs given with rasagiline, avoid MAOs for at least 2 weeks after stopping rasagiline; enhanced hypotensive effect when MAOIs given with selegiline—manufacturer of selegiline advises avoid concomitant use; avoid concomitant use of MAOIs with tolcapone.

Doxapram: MAOIs enhance effects of doxapram.

Histamine: avoidance of MAOIs advised by manufacturer of histamine.

- H1, Agonists: risk of CNS toxicity when MAOIs given with rizatRIPTAN or sumatriptan (avoid rizatRIPTAN or sumatriptan for 2 weeks after MAOIs); increased risk of CNS toxicity when MAOIs given with zolmitriptan.

- Methylxophip: avoidance of MAOs advised by manufacturer of methylxophip.

Moxonidine: enhanced hypotensive effect when MAOIs given with moxonidine.

Muscle Relaxants: phenelzine enhances effects of saxenethionum.

Nicardipine: enhanced hypotensive effect when MAOIs given with nicardipine.

Nitrates: enhanced hypotensive effect when MAOIs given with nitrates.

Pholcodine: avoidance of pholcodine for 2 weeks after stopping MAOIs advised by manufacturer of pholcodine.

- Sympathomimetis: risk of hypertensive crisis when MAOIs given with sympathomimetis; risk of hypertensive crisis when MAOIs given with methyphendidate, some manufacturers advise avoiding methyphendidate for at least 2 weeks after stopping MAOIs.

- Tetrabenazine: risk of CNS excitation and hypertension when MAOIs given with tetrabenazine.

- Vasodilators: Antihypertensives: enhanced hypotensive effect when MAOIs given with hydralazine, minoxidil or sodium nitroprusside.

MAOIs, reversible: see Moclobemide.

Maraviroc

- Antibacterials: plasma concentration of maraviroc possibly increased by clarithromycin and telithromycin (consider reducing dose of maraviroc).

- Anticonvulsants: plasma concentration of maraviroc possibly increased by rifampicin—consider increasing dose of maraviroc.

- Antidepressants: plasma concentration of maraviroc possibly reduced by St John’s wort—avoid concomitant use.

- Antifungals: plasma concentration of maraviroc increased by ketoconazole (consider reducing dose of maraviroc).

- Antivirals: plasma concentration of maraviroc increased by atazanavir, darunavir, indinavir, lopinavir and saquinavir (consider reducing dose of maraviroc); plasma concentration of maraviroc possibly increased by efavirenz—consider increasing dose of maraviroc; plasma concentration of maraviroc possibly reduced by etravirine; plasma concentration of maraviroc possibly increased by nefinavir (consider reducing dose of maraviroc); plasma concentration of maraviroc increased by ritonavir.

Mebendazole

- Ulcer-healing Drugs: metabolism of mebendazole possibly inhibited by cimetidine (increased plasma concentration).

Mefloquine

- Anti-arrhythmics: increased risk of ventricular arrhythmias when mefloquine given with amiodarone—avoid concomitant use.

- Antifungals: mefloquine antagonises anticonvulsant effect of antiepileptics.

- Antihistamines: increased risk of convulsions when mefloquine given with haloperidol—avoid concomitant use; increased risk of ventricular arrhythmias when mefloquine given with oxazolidinones—avoid concomitant use; increased risk of convulsions when mefloquine given with quinine (but should not prevent the use of intravenous quinine in severe cases).

- Antipsychotics: possible increased risk of ventricular arrhythmias when mefloquine given with haloperidol—avoid concomitant use; increased risk of ventricular arrhythmias when mefloquine given with thioridazine—avoid concomitant use.

- Atorvastatin: increased risk of ventricular arrhythmias when mefloquine given with atorvastatin.

- Beta-blockers: increased risk of bradycardia when mefloquine given with beta-blockers.

- Calcium-channel Blockers: possible increased risk of bradycardia when mefloquine given with calcium-channel blockers.

- Cardiac Glycosides: possible increased risk of bradycardia when mefloquine given with digoxin.
Mefloquine (continued)
Histamine: avoidance of antimalarials advised by manufacturer of histamine
● Ibravadin: increased risk of ventricular arrhythmias when mefloquine given with ibradavin
Vaccines: antimalarials inactivate oral typhoid vaccine—see p. 767
Megestrol see Progestogens
Melatonin see Anxiolytics and Hypnotics
Meloxicam see NSAIDs
Melphalan
Antibacterials: increased risk of melphalan toxicity when given with nalidixic acid
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
● Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
● Ciclosporin: increased risk of nephrotoxicity when melphalan given with ciclosporin
Memantine
● Anaesthetics, General: increased risk of CNS toxicity when memantine given with ketamine (manufacturer of memantine advises avoid concomitant use)● Analgesics: increased risk of CNS toxicity when memantine given with dexromethorphan (manufacturer of memantine advises avoid concomitant use)Anticoagulants: memantine possibly enhances anti-coagulant effect of warfarin
Antiepileptics: memantine possibly reduces effects of primidone
Antimuscarinics: memantine possibly enhances effects of antimuscarinics
Antipyschotics: memantine possibly reduces effects of antipsychotics
Barbiturates: memantine possibly reduces effects of barbiturates
● Dopaminergics: memantine possibly enhances effects of dopaminergics and selegiline; increased risk of CNS toxicity when memantine given with amantadine (manufacturer of memantine advises avoid concomitant use)Muscle Relaxants: memantine possibly modifies effects of baclofen and dantrolene
Mepacrine
Antimalarials: mepacrine increases plasma concentration of primaquine (increased risk of toxicity)Meprobamate see Anxiolytics and Hypnotics
Mepatolazone see Opioid Analgesics
Mercaptopurine
● Allopurinol: increased risk of leucopenia when mercaptopurine given with aminosalicylates; possible increased risk of leukopenia when mercaptopurine given with aminosalicylates
● Anti-infectives: increased risk of haematological toxicity when mercaptopurine given with trimethoprim (also with co-trimoxazole)Aminosalicylates: possible increased risk of leucopenia when mercaptopurine given with aminosalicylates
● Anti-infectives: increased risk of haematological toxicity when mercaptopurine given with trimethoprim (also with co-trimoxazole)Aminosalicylates: possible increased risk of leucopenia when mercaptopurine given with aminosalicylates
● Anticoagulants: mercaptopurine possibly reduces anticoagulant effect of coumarins
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
● Fexofenadine: avoidance of mercaptopurine advised by manufacturer of fexofenadine
Meropenem
● Antiepileptics: carbapenems reduce plasma concentration of valproate—avoid concomitant use
Meropenem (continued)
Probencid: excretion of meropenem reduced by probenecid
Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 767
Mesalazine see Aminosalicylates
Mestranol see Oestrogens
Metaraminol see Sympathomimetics
Metformin see Antidiabetics
Methadone see Opioid Analgesics
Methenamine
Antacids: avoid concomitant use of methenamine with antacids
● Antibacterials: increased risk of crystalluria when methenamine given with sulfonamides
● Diuretics: effects of methenamine antagonised by acetazolamide
Potassium Salts: avoid concomitant use of methenamine with potassium citrate
Sodium Citrate: avoid concomitant use of methenamine with sodium citrate
Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 767
Methocarbamol see Muscle Relaxants
Methotrexate
● Anaesthetics, General: antifolate effect of methotrexate increased by nitrous oxide—avoid concomitant use
● Analgesics: excretion of methotrexate probably reduced by NSAIDs (increased risk of toxicity)—but for concomitant use in rheumatic disease see p. 647; excretion of methotrexate reduced by aspirin, diclofenac, ibuprofen, endometacin, ketoprofen, meloxicam and enaproxen (increased risk of toxicity)—but for concomitant use in rheumatic disease see p. 647
● Antibacterials: absorption of methotrexate possibly reduced by neomycin; excretion of methotrexate possibly reduced by ciprofloxacin (increased risk of toxicity); increased risk of haematological toxicity when methotrexate given with sulfamethoxazole (as co-trimoxazole); increased risk of methotrexate toxicity when given with doxycycline, sulfonamides or tetracycline; excretion of methotrexate reduced by penicillins (increased risk of toxicity); increased risk of haematological toxicity when methotrexate given with trimethoprim (also with co-trimoxazole)Antipyschotics: antifolate effect of methotrexate increased by phenytoin; cytotoxics possibly reduce absorption of phenytoin
● Antimalarials: antifolate effect of methotrexate increased by pyrimethamine
● Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
● Ciclosporin: risk of toxicity when methotrexate given with ciclosporin
● Cytotoxics: increased pulmonary toxicity when methotrexate given with cisplatin
Diuretics: excretion of methotrexate increased by alkaline urine due to acetazolamide
Leflunomide: risk of toxicity when methotrexate given with leflunomide
● Probencid: excretion of methotrexate reduced by probenecid (increased risk of toxicity)
● Retinoids: plasma concentration of methotrexate increased by acitretin (also increased risk of hepatotoxicity)—avoid concomitant useTherophyline: methotrexate possibly increases plasma concentration of theophylline
Ulcer-healing Drugs: excretion of methotrexate possibly reduced by omeprazole (increased risk of toxicity)
Methoxamine see Sympathomimetics
Appendix 1: Interactions
BNF 61
Methyldopa
ACE Inhibitors: enhanced hypotensive effect when methyldopa given with ACE inhibitors
Alpha-2 Adrenergic Neurone Blockers: enhanced hypotensive effect when methyldopa given with α2-adrenergic neurone blockers
Alcohol: enhanced hypotensive effect when methyldopa given with alcohol
Aldose 1-kinase: enhanced hypotensive effect when methyldopa given with aldose 1-kinase
Alpha-blockers: enhanced hypotensive effect when methyldopa given with alpha-blockers
Anaesthetics, General: enhanced hypotensive effect when methyldopa given with general anaesthetics
Analgesics: hypotensive effect of methyldopa antagonised by NSAIDs
Angiotensin II Receptor Antagonists: enhanced hypotensive effect when methyldopa given with angiotensin II receptor antagonists
Antidepressants: manufacturer of methyldopa advises avoid concomitant use with MAOIs
Antipsychotics: enhanced hypotensive effect when methyldopa given with antipsychotics (also increased risk of extrapyramidal effects)
Anti-inflammatory agents: enhanced hypotensive effect when methyldopa given with anti-inflammatory agents and hypnotics
Beta-blockers: enhanced hypotensive effect when methyldopa given with beta-blockers
Calcium-channel Blockers: enhanced hypotensive effect when methyldopa given with calcium-channel blockers
Clonidine: enhanced hypotensive effect when methyldopa given with clonidine
Corticosteroids: hypotensive effect of methyldopa antagonised by corticosteroids
Diazoxide: enhanced hypotensive effect when methyldopa given with diazoxide
Diuretics: enhanced hypotensive effect when methyldopa given with diuretics
Dopaminergics: methyldopa antagonises antiparkinsonian effect of dopaminergics; increased risk of extrapyramidal side-effects when methyldopa given with amantadine; effects of methyldopa possibly enhanced by entacapone; enhanced hypotensive effect when methyldopa given with levodopa; iron: hypotensive effect of methyldopa antagonised by oral iron
Lithium: neurotoxicity may occur when methyldopa given with lithium without increased plasma concentration of lithium
Moxisylyte: enhanced hypotensive effect when methyldopa given with moxisylyte
Moxonidine: enhanced hypotensive effect when methyldopa given with moxonidine
Muscle Relaxants: enhanced hypotensive effect when methyldopa given with baclofen or tizanidine
Nitrites: enhanced hypotensive effect when methyldopa given with nitrites
Oestrone: hypotensive effect of methyldopa antagonised by oestrone
Prostaglandins: enhanced hypotensive effect when methyldopa given with alprostadil
Sympathomimetics, β2: acute hypotension reported when methyldopa given with infusion of isobutylamine
Vasoconstrictor Antihypertensives: enhanced hypotensive effect when methyldopa given with hydralazine, minoxidil or sodium nitroprusside
Methylphenidate see Sympathomimetics
Methylprednisolone see Corticosteroids
Methysergide see Ergot Alkaloids
Metipranolol see Beta-blockers
Metoclopramide
Anaesthetics, General: metoclopramide enhances effects of thiopental
Analgesics: metoclopramide increases rate of absorption of aspirin (enhanced effect); effects of

"Appendix 1: Interactions"

Metoclopramide
Analgesics (continued)
metoclopramide on gastro-intestinal activity antagonised by opioid analgesics; metoclopramide increases rate of absorption of paracetamol
Antiinflammatory agents: effects of metoclopramide on gastro-intestinal activity antagonised by antiinflammatory agents
Antipsychotics: increased risk of extrapyramidal side-effects when metoclopramide given with antipsychotics
Atovaquone: metoclopramide reduces plasma concentration of atovaquone
Dopaminergic: metoclopramide increases plasma concentration of clozapine
Dopamine antagonists: metoclopramide antagonises hypoprolactinaemic effects of bromocriptine and cabergoline; metoclopramide antagonises antiparkinsonian effect of pergolide; avoidance of metoclopramide advised by manufacturer of ropinirole and rotigotine (antagonism of effect)
Muscle Relaxants: metoclopramide enhances effects of aminophylline
Tetrabenazine: increased risk of extrapyramidal side-effects when metoclopramide given with tetrabenazine

Methylxantheine see Diuretics
Metoprolol see Beta-blockers
Metronidazole
Note: Interactions do not apply to topical metronidazole preparations
Alcohol: disulfram-like reaction when metronidazole given with alcohol
Anticoagulants: metronidazole enhances anticoagulant effect of coumarins
Antiepileptics: metronidazole inhibits metabolism of phenytoin (increased plasma concentration); metabolism of metronidazole accelerated by primidone (reduced plasma concentration)
Barbiturates: metabolism of metronidazole accelerated by barbiturates (reduced plasma concentration)
Cytotoxics: metronidazole increases plasma concentration of etoposide (increased risk of toxicity); metronidazole inhibits metabolism of fluorouracil (increased toxicity)
Dissulfiram: psychic reaction reported when metronidazole given with disulfiram
Lithium: metronidazole increases risk of lithium toxicity
Mycophenolate: metronidazole possibly reduces bioavailability of mycophenolate
Ulcer-healing Drugs: metabolism of metronidazole inhibited by cimetidine (increased plasma concentration)
Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 767
Mianserin see Antidepressants, Tricyclic (related)
Mifafostin Antifungals: mifafostin possibly increases plasma concentration of amphotericin; mifafostin increases plasma concentration of itraconazole (consider reducing dose of itraconazole)
Cytotoxic (related): mifafostin possibly increases plasma concentration of cyclosporin
Siroliumus: mifafostin increases plasma concentration of sirolimus
Miconazole see Antifungals, Imidazole
Midazolam see Anxietytics and Hypnotics

**BNF 61**

**Appendix 1: Interactions**

---

**Mifamurtide (continued)**

Tacrolimus: manufacturer of mifamurtide advises avoid concomitant use with tacrolimus

**Mifepristone**

Corticosteroids: mifepristone may reduce effect of corticosteroids (including inhaled corticosteroids) for 3–4 days

**Mirtazapine**

- Alcohol: increased sedative effect when mirtazapine given with alcohol
- Analgesics: increased serotonergic effects when mirtazapine given with tramadol
- Anticoagulants: decreased anticoagulant effect of warfarin
- Antidepressants: possible increased serotonergic effects when mirtazapine given with fluoxetine, fluvoxamine or venlafaxine; mirtazapine should not be started until at least 2 weeks after stopping MAOIs; also MAOIs should not be started until at least 2 weeks after stopping mirtazapine; after stopping mirtazapine do not start mirtazapine for at least 1 week
- Antiepileptics: plasma concentration of mirtazapine reduced by carbamazepine and phenytoin
- Antifungals: plasma concentration of mirtazapine increased by ketoconazole
- Antimalarials: avoidance of antidepressants advised by manufacturer of arteether/lumefantrine
- Anxiolytics and Hypnotics: increased sedative effect when mirtazapine given with anxiolytics and hypnotics
- Atropine: possible increased risk of convulsions when antidepressants given with atomoxetine
- Ulcer-healing Drugs: plasma concentration of mirtazapine increased by cimetidine

**Mitomycin**

- Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
- Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Anticoagulants: mitotane possibly reduces anticoagulant effect of warfarin
- Antidepressants: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
- Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Diazoxide: increased risk of CNS toxicity when mirtazapine given with clozapine (increased risk of agranulocytosis)
- Carbamazepine: increased risk of CNS toxicity when mirtazapine given with carbamazepine and phenytoin
- Atropine: possible increased risk of convulsions when antidepressants given with atomoxetine
- Mifepristone: mifepristone may reduce effect of mirtazapine
- Selegiline: possible increased risk of convulsions when antidepressants given with atomoxetine
- Modafinil: modafinil possibly increases plasma concentration of phenoxybenzamine
- Diazoxide: enhanced hypotensive effect when moxisylyte given with moxisylyte given with diazoxide
- Calcium-channel Blockers: enhanced hypotensive effect when moxisylyte given with calcium-channel blockers
- Clonidine: enhanced hypotensive effect when moxisylyte given with clonidine
- Diazoxide: enhanced hypotensive effect when moxisylyte given with diazoxide
- Diuretics: enhanced hypotensive effect when moxisylyte given with diuretics
- Methyldopa: enhanced hypotensive effect when moxisylyte given with methyldopa
- Moxonidine: enhanced hypotensive effect when moxisylyte given with moxonidine
- Nitrites: enhanced hypotensive effect when moxisylyte given with nitrites

---

**Moxisylyte**

- ACE Inhibitors: enhanced hypotensive effect when moxisylyte given with ACE inhibitors
- Adrenergic Neurone Blockers: enhanced hypotensive effect when moxisylyte given with adrenergic neurone blockers
- Alpha-blockers: possible severe postural hypotension when moxisylyte given with alpha-blockers
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when moxisylyte given with angiotensin-II receptor antagonists
- Beta-blockers: possible severe postural hypotension when moxisylyte given with beta-blockers
- Calcium-channel Blockers: enhanced hypotensive effect when moxisylyte given with calcium-channel blockers
- Clonidine: enhanced hypotensive effect when moxisylyte given with clonidine
- Diazoxide: enhanced hypotensive effect when moxisylyte given with diazoxide
- Diuretics: enhanced hypotensive effect when moxisylyte given with diuretics
- Methyldopa: enhanced hypotensive effect when moxisylyte given with methyldopa
- Moxonidine: enhanced hypotensive effect when moxisylyte given with moxonidine
- Nitrites: enhanced hypotensive effect when moxisylyte given with nitrites

---

**Moclobemide**

- Antidepressants (continued)
  - related antidepressants, citalopram, fluvoxamine, mirtazapine, paroxetine, sertraline, tricyclic-related antidepressants or tricyclics: increased risk of CNS toxicity when moclobemide given with citalopram, preferably avoid concomitant use; moclobemide should not be started until 5 weeks after stopping fluoxetine; possible increased serotonergic effects when moclobemide given with duloxetine
  - Antimalarials: avoidance of antidepressants advised by manufacturer of arteether/lumefantrine
  - Antiepileptics: possibly reduce absorption
  - Dopaminergics: caution with moclobemide advised by manufacturer of entacapone; increased risk of side-effects when moclobemide given with levodopa; avoid concomitant use of moclobemide with selegiline
  - 5HT, Agonists: risk of CNS toxicity when moclobemide given with eritritapran or sumatriptan (avoid ritritapran or sumatriptan for 2 weeks after moclobemide); risk of CNS toxicity when moclobemide given with zolmitrpan (reduce dose of zolmitrpan)
  - Sympathomimetics: risk of hypertensive crisis when moclobemide given with sympathominetics
  - Ulcer-healing Drugs: plasma concentration of moclobemide increased by cimetidine (halve dose of moclobemide)

---

**Methyldopa**

- ACE Inhibitors: enhanced hypotensive effect when moxisylyte given with ACE inhibitors
- Adrenergic Neurone Blockers: enhanced hypotensive effect when moxisylyte given with adrenergic neurone blockers
- Alpha-blockers: possible severe postural hypotension when moxisylyte given with alpha-blockers
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when moxisylyte given with angiotensin-II receptor antagonists
- Beta-blockers: possible severe postural hypotension when moxisylyte given with beta-blockers
- Calcium-channel Blockers: enhanced hypotensive effect when moxisylyte given with calcium-channel blockers
- Clonidine: enhanced hypotensive effect when moxisylyte given with clonidine
- Diazoxide: enhanced hypotensive effect when moxisylyte given with diazoxide
- Diuretics: enhanced hypotensive effect when moxisylyte given with diuretics
- Methyldopa: enhanced hypotensive effect when moxisylyte given with methyldopa
- Moxonidine: enhanced hypotensive effect when moxisylyte given with moxonidine
- Nitrites: enhanced hypotensive effect when moxisylyte given with nitrites
Appendix 1: Interactions

**Moxisylyte (continued)**

Vasodilator Antihypertensives; enhanced hypotensive effect when moxisylyte given with hydralazine, minoxidil, or sodium nitroprusside

**Moxonidine**

ACE Inhibitors: enhanced hypotensive effect when moxonidine given with ACE inhibitors

Adrenergic Neurome Blockers: enhanced hypotensive effect when moxonidine given with adrenergic neuromne blockers

Alcohol: enhanced hypotensive effect when moxonidine given with alcohol

Aldesleukin: enhanced hypotensive effect when moxonidine given with aldesleukin

Alpha-blockers: enhanced hypotensive effect when moxonidine given with alpha-blockers

Anesthetics, General: enhanced hypotensive effect when moxonidine given with general anaesthetics

Analgesics: hypotensive effect of moxonidine antagonised by NSAIDs

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when moxonidine given with angiotensin-II receptor antagonists

Antidepressants: enhanced hypotensive effect when moxonidine given with MAOIs; hypotensive effect of moxonidine possibly antagonised by tricyclics (manufacturer of moxonidine advises avoid concomitant use)

Anxiolytics and Hypnotics: enhanced hypotensive effect when moxonidine given with phenothiazines

Anxiolytics and Hypnotics: enhanced hypotensive effect when moxonidine given with anxiolytics and hypnotics; sedative effects possibly increased when moxonidine given with benzodiazepines

Beta-blockers: enhanced hypotensive effect when moxonidine given with beta-blockers

Calcium-channel Blockers: enhanced hypotensive effect when moxonidine given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when moxonidine given with clonidine

Corticosteroids: hypotensive effect of moxonidine antagonised by corticosteroids

Diazoxide: enhanced hypotensive effect when moxonidine given with diazoxide

Diuretics: enhanced hypotensive effect when moxonidine given with diuretics

Dopaminergics: enhanced hypotensive effect when moxonidine given with levodopa

Methylodopa: enhanced hypotensive effect when moxonidine given with methylodopa

Moxisylyte: enhanced hypotensive effect when moxonidine given with moxisylyte

Muscle Relaxants: enhanced hypotensive effect when moxonidine given with muscle relaxants

Nitrates: enhanced hypotensive effect when moxonidine given with nitrates

Oestrogens: hypotensive effect of moxonidine antagonised by oestrogens

Prostaglandins: enhanced hypotensive effect when moxonidine given with prostaglandins

Cardiac Glycosides: possible increased risk of bradycardia when tizanidine given with cardiac glycosides; risk of ventricular arrhythmias when suxamethonium given with cardiac glycosides

Clonidine: enhanced hypotensive effect when baclofen or tizanidine given with clonidine

Corticosteroids: effects of pancuronium and vecuronium possibly antagonised by corticosteroids

Cytotoxics: effects of suxamethonium enhanced by cyclophosphamide and thiopeta

Diazoxide: enhanced hypotensive effect when baclofen or tizanidine given with diazoxide

Diuretics: enhanced hypotensive effect when baclofen or tizanidine given with diuretics

Dopaminergics: possible agitation, confusion and hallucinations when baclofen given with levodopa

**Muscle Relaxants**

- Anaesthetics, General (continued)
  - muscle relaxants and suxamethonium enhanced by volatile liquid general anaesthetics
  - Analgesics: excretion of baclofen possibly reduced by NSAIDs (increased risk of toxicity); excretion of baclofen reduced by ibuprofen (increased risk of toxicity); increased sedative effect when baclofen given with fentanyl or morphine
  - Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when baclofen or tizanidine given with angiotensin-II receptor antagonists
  - Anti-arrhythmics: neuromuscular blockade enhanced and prolonged when suxamethonium given with lidocaine
  - Antibacterials: effects of non-depolarising muscle relaxants and suxamethonium enhanced by piperacillin; plasma concentration of tizanidine increased by ciprofloxacin (increased risk of toxicity)—avoid concomitant use; plasma concentration of tizanidine possibly increased by norfloxacin (increased risk of toxicity); effects of non-depolarising muscle relaxants and suxamethonium enhanced by aminglucosides; effects of non-depolarising muscle relaxants and suxamethonium enhanced by clindamycin; effects of non-depolarising muscle relaxants and suxamethonium enhanced by polymyxins; effects of suxamethonium enhanced by vancomycin
  - Antidepressants: plasma concentration of tizanidine increased by fluvoxamine (increased risk of toxicity)—avoid concomitant use; effects of suxamethonium enhanced by phentolamine; muscle relaxant effect of baclofen enhanced by tricyclics
  - Antiepileptics: muscle relaxant effect of non-depolarising muscle relaxants antagonised by carbamazepine and phentoin (accelerated recovery from neuromuscular blockade)
  - Antimalarials: effects of suxamethonium possibly enhanced by quinine
  - Antipsychotics: effects of suxamethonium possibly enhanced by promazine
  - Anxiolytics and Hypnotics: enhanced hypotensive effect when baclofen or tizanidine given with anxiolytics and hypnotics

Beta-blockers: enhanced hypotensive effect when baclofen given with beta-blockers; possible enhanced hypotensive effect and bradycardia when tizanidine given with beta-blockers; effects of muscle relaxants enhanced by propranolol

Calcium-channel Blockers: enhanced hypotensive effect when baclofen or tizanidine given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when baclofen or tizanidine given with clonidine

Corticosteroids: effects of non-depolarising muscle relaxants possibly enhanced by calcium-channel blockers; possible increased risk of ventricular arrhythmias when intravenous dantrolene given with diltiazem—manufacturer of diltiazem advises avoid concomitant use; effects of non-depolarising muscle relaxants and suxamethonium enhanced by verapamil; hypotension, myocardial depression, and hyperkalaemia when intravenous dantrolene given with verapamil

Cardiac Glycosides: possible increased risk of bradycardia when tizanidine given with cardiac glycosides; risk of ventricular arrhythmias when suxamethonium given with cardiac glycosides

Clonidine: enhanced hypotensive effect when baclofen or tizanidine given with clonidine

Corticosteroids: effects of pancuronium and vecuronium possibly antagonised by corticosteroids

Cytotoxics: effects of suxamethonium enhanced by cyclophosphamide and thiopeta

Diazoxide: enhanced hypotensive effect when baclofen or tizanidine given with diazoxide

Diuretics: enhanced hypotensive effect when baclofen or tizanidine given with diuretics

Dopaminergics: possible agitation, confusion and hallucinations when baclofen given with levodopa

Muscle Relaxants: enhanced hypotensive effect when baclofen or tizanidine given with muscle relaxants; effects of non-depolarising muscle relaxants enhanced by muscle relaxants possibly enhanced by calcium-channel blockers; possible increased risk of ventricular arrhythmias when intravenous dantrolene given with diltiazem—manufacturer of diltiazem advises avoid concomitant use; effects of non-depolarising muscle relaxants and suxamethonium enhanced by verapamil; hypotension, myocardial depression, and hyperkalaemia when intravenous dantrolene given with verapamil

Cardiac Glycosides: possible increased risk of bradycardia when tizanidine given with cardiac glycosides; risk of ventricular arrhythmias when suxamethonium given with cardiac glycosides

Clonidine: enhanced hypotensive effect when baclofen or tizanidine given with clonidine

Corticosteroids: effects of pancuronium and vecuronium possibly antagonised by corticosteroids

Cytotoxics: effects of suxamethonium enhanced by cyclophosphamide and thiopeta

Diazoxide: enhanced hypotensive effect when baclofen or tizanidine given with diazoxide

Diuretics: enhanced hypotensive effect when baclofen or tizanidine given with diuretics

Dopaminergics: possible agitation, confusion and hallucinations when baclofen given with levodopa
Muscle Relaxants (continued)
Lithium: effects of muscle relaxants enhanced by lithium; baclofen possibly aggravates hyperkinesia caused by lithium
Magnesium (parenteral): effects of non-depolarising muscle relaxants and suxamethonium enhanced by parenteral magnesium
Mefitoxoamine: effects of baclofen and dantrolene possibly modified by mefenoxamine
Methyldopa: enhanced hypotensive effect when baclofen or tizanidine given with methyldopa
Metoclopramide: effects of suxamethonium enhanced by metoclopramide
Moxonidine: enhanced hypotensive effect when baclofen or tizanidine given with moxonidine
Natrium: enhanced hypotensive effect when baclofen or tizanidine given with natrium
Oestrogens: plasma concentration of tizanidine possibly increased by oestrogens (increased risk of toxicity)
Parasymptomimetics: effects of non-depolarising muscle relaxants possibly antagonised by donepezil; effects of suxamethonium possibly enhanced by donepezil; effects of non-depolarising muscle relaxants antagonised by edrophonium, neostigmine, pyridostigmine and rivastigmine; effects of suxamethonium enhanced by edrophonium, galantamine, neostigmine, pyridostigmine and rivastigmine
Progestogens: plasma concentration of tizanidine possibly increased by progestogens (increased risk of toxicity)
Sympathomimetics, Beta; effects of suxamethonium enhanced by bamberuter
Vasodilator Antihypertensives: enhanced hypotensive effect when baclofen or tizanidine given with hydralazine; enhanced hypotensive effect when baclofen or tizanidine given with minoxidil; enhanced hypotensive effect when baclofen or tizanidine given with sodium nitroprusside
Muscle Relaxants, depolarising see Muscle Relaxants
Muscle Relaxants, non-depolarising see Muscle Relaxants
Mycophenolate
Antacids: absorption of mycophenolate reduced by antacids
Antibacterials: bioavailability of mycophenolate possibly reduced by metronidazole and norfloxacin; plasma concentration of active metabolite of mycophenolate possibly reduced by rifampicin
Antivirals: mycophenolate increases plasma concentration of aciclovir, also plasma concentration of inactive metabolite of mycophenolate increased; mycophenolate possibly increases plasma concentration of ganciclovir, also plasma concentration of active metabolite of mycophenolate possibly increased
Iron: absorption of mycophenolate reduced by oral iron
Lipid-regulating Drugs: absorption of mycophenolate reduced by colesteotamine
Sevelamer: plasma concentration of mycophenolate possibly reduced by sevelamer
Mycophenolate Mofetil see Mycophenolate
Mycophenolate Sodium see Mycophenolate
Mycophenolic Acid see Mycophenolate
Nabionole Alcohol: increased sedative effect when nabionole given with alcohol
Anxiolytics and Hypnotics: increased sedative effect when nabionole given with anxiolytics and hypnotics
Nabumetone see NSAIDs
Nadolol see Beta-blockers
Nalidixic Acid see Quinolones
Nandrolone see Anabolic Steroids
Naproxen see NSAIDs
Naratiplan see SHT, Agonists
Nateglinide see Antidiabetics
Nebivolol see Beta-blockers
Nefopan
Antidepressants: manufacturer of nefopam advises avoid concomitant use with MAOIs; side-effects possibly increased when nefopam given with tricyclics
Antimuscarincs: increased risk of antimuscarinic side-effects when nefopam given with antimuscarincs
Nelfinavir
Analgesics: nelfinavir reduces plasma concentration of methadone
Anti-arrhythmics: increased risk of ventricular arrhythmias when nelfinavir given with amiodarone—avoid concomitant use
Antibacterials: nelfinavir increases plasma concentration of rifabutin (halve dose of rifabutin); plasma concentration of nelfinavir significantly reduced by ertapenem—avoid concomitant use; avoidance of concomitant nelfinavir in severe renal and hepatic impairment advised by manufacturer of telithromycin
Anticoagulants: avoidance of nelfinavir advised by manufacturer of rivaroxaban
Antidepressants: plasma concentration of nelfinavir reduced by St John’s wort—avoid concomitant use
Antiepileptics: plasma concentration of nelfinavir possibly reduced by carbamazepine and primidone; nelfinavir reduces plasma concentration of phenytoin
Antimalarials: caution with nelfinavir advised by manufacturer of arteether/lumefantrine; nelfinavir possibly increases plasma concentration of quinine (increased risk of toxicity)
Antimuscarincs: avoidance of nelfinavir advised by manufacturer of darifenac and tolterodine; manufacturer of fesoterodine advises dose reduction when nelfinavir given with fesoterodine—consult fesoterodine product literature; nelfinavir increases plasma concentration of solifenacin
Antipsychotics: nelfinavir possibly inhibits metabolism of aripiprazole (reduce dose of aripiprazole); nelfinavir possibly increases plasma concentration of ephedrine (increased risk of ventricular arrhythmias—avoid concomitant use)
Antivirals: plasma concentration of nelfinavir possibly increased by stravatine—avoid concomitant use; combination of nelfinavir with indinavir or ritonavir may increase plasma concentration of either drug (or both); nelfinavir reduces plasma concentration of lopinavir; also plasma concentration of active metabolite of nelfinavir increased; nelfinavir possibly increases plasma concentration of maraviroc (consider reducing dose of maraviroc); nelfinavir increases plasma concentration of everolimus—manufacturer of saquinavir advises avoid concomitant use
Anxiolytics and Hypnotics: nelfinavir possibly increases plasma concentration of midazolam (risk of prolonged sedation—avoid concomitant use of oral midazolam)
Barbiturates: plasma concentration of nefopam possibly reduced by barbiturates
Ciclosporin: nelfinavir possibly increases plasma concentration of ciclosporin
Corticosteroids: nelfinavir possibly increases plasma concentration of inhaled and intranasal fluticasone
Cytoxotics: nelfinavir possibly increases plasma concentration of everolimus—manufacturer of everolimus advises avoid concomitant use; avoidance of nelfinavir advised by manufacturer of pazopanib; nelfinavir increases plasma concentration of paclitaxel
Diuretics: nelfinavir increases plasma concentration of spironolactone—avoid concomitant use
Ergot Alkaloids: increased risk of ergotism when nelfinavir given with ergotamine and methylergometrine—avoid concomitant use
Appendix 1: Interactions
Nelfinavir (continued)
- SHT, Agonists: nelfinavir increases plasma concentration of etrindipine (risk of toxicity)—avoid concomitant use
- Ibradibine: nelfinavir possibly increases plasma concentration of aibradibine—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when nelfinavir given with atorvastatin; possible increased risk of myopathy when nelfinavir given with rosuvastatin—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when nelfinavir given with simvastatin (avoid concomitant use)
- Oestrogens: nelfinavir accelerates metabolism of oestrogens (reduced contraceptive effect—see p. 495)
- Progestogens: nelfinavir possibly reduces contraceptive effect of progestogens
- Ranolazine: nelfinavir possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Sildenafil: nelfinavir possibly increases plasma concentration of sildenafil—reduce initial dose of sildenafil
- Tacrolimus: nelfinavir possibly increases plasma concentration of tacrolimus
- Ulcer-healing Drugs: plasma concentration of nelfinavir reduced by omeprazole—avoid concomitant use
- Neomycin see Aminoglycosides
- Neostigmine see Parasympathomimetics
Nevirapine
- Analgesics: nevirapine possibly reduces plasma concentration of methadone
- Antibacterials: nevirapine reduces plasma concentration of clarithromycin (but concentration of an active metabolite increased), also plasma concentration of nevirapine increased; nevirapine possibly increases plasma concentration of rifabutin; plasma concentration of nevirapine reduced by rifampicin—avoid concomitant use
- Anticoagulants: nevirapine may enhance or reduce anticoagulant effect of warfarin
- Antidepressants: plasma concentration of nevirapine reduced by St John's wort—avoid concomitant use
- Antiepileptics: plasma concentration of nevirapine reduced by carbamazepine
- Antifungals: nevirapine reduces plasma concentration of ketoconazole—avoid concomitant use; plasma concentration of nevirapine increased by fluconazole; nevirapine possibly reduces plasma concentration of caspofungin and itraconazole—consider increasing dose of caspofungin and itraconazole
- Antipsychotics: nevirapine possibly reduces plasma concentration of aripiprazole—increase dose of aripiprazole
- Antivirals: nevirapine possibly reduces plasma concentration of stavudine and efavirenz—avoid concomitant use; nevirapine reduces plasma concentration of efavirenz and indinavir; nevirapine possibly plasma concentration of fosamprenavir; nevirapine possibly reduces plasma concentration of lopinavir—consider increasing dose of lopinavir
- Oestrogens: nevirapine accelerates metabolism of oestrogens (reduced contraceptive effect—see p. 495)
- Progestogens: nevirapine accelerates metabolism of progestogens (reduced contraceptive effect—see p. 495)
Nicolipid see Calcium-channel Blockers
Nicorandil
- Alcohol: hypotensive effect of nicorandil possibly enhanced by alcohol
- Antidepressants: enhanced hypotensive effect when nicorandil given with MAOIs; hypotensive effect of nicorandil possibly enhanced by tricyclics
BNF 61

Appendix 1: Interactions 861

Nitrates (continued)
Antipsychotics: enhanced hypotensive effect when nitrates given with phenothiazines

Antiemetics and Hypnotics; enhanced hypotensive effect when nitrates given with antiemetics and hypnotics

Beta-blockers: enhanced hypotensive effect when nitrates given with beta-blockers

Calcium-channel Blockers: enhanced hypotensive effect when nitrates given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when nitrates given with clonidine

Corticosteroids: hypotensive effect of nitrates antagonised by corticosteroids

Diazoxide: enhanced hypotensive effect when nitrates given with diazoxide

Diuretics: enhanced hypotensive effect when nitrates given with diuretics

Dopaminergics: enhanced hypotensive effect when nitrates given with levodopa

Methyldopa: enhanced hypotensive effect when nitrates given with methyldopa

Moxisylyte: enhanced hypotensive effect when nitrates given with moxisylyte

Moxonidine: enhanced hypotensive effect when nitrates given with moxonidine

Muscle Relaxants: enhanced hypotensive effect when nitrates given with baclofen or tizanidine

Oestrogens: hypotensive effect of nitrates antagonised by oestrogens

Prostaglandins: enhanced hypotensive effect when nitrates given with alprostadil

Sildenafil: hypotensive effect of nitrates significantly enhanced by sildenafil (avoid concomitant use)

Tadalafil: hypotensive effect of nitrates significantly enhanced by tadalafil (avoid concomitant use)

Vardenafil: possible increased hypotensive effect when nitrates given with vardenafil—avoid concomitant use

Vasodilator Antihypertensives: enhanced hypotensive effect when nitrates given with hydralazine, minoxidil or sodium nitroprusside

Nitrazepam see Antiemetics and Hypnotics

Nitrofurantoin
Antacids: absorption of nitrofurantoin reduced by oral magnesium salts (as magnesium trisilicate)

Antibacterials: nitrofurantoin possibly antagonises effects of nalidixic acid

Probenecid: excretion of nitrofurantoin reduced by probenecid (increased risk of side-effects)

Sulfinpyrazone: excretion of nitrofurantoin reduced by sulfinpyrazone (increased risk of toxicity)

Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 767

Nitroimidazoles see Metronidazole and Tinidazole

Nitrous Oxide see Anaesthetics, General

Nizatidine see Histamine H₂-antagonists

Noradrenaline (norepinephrine) see Sympathomimetics

Norelgestromin see Progestogens

Norepinephrine (noradrenaline) see Sympathomimetics

Nor ethisterone see Progestogens

Norfl oxacin see Quinolones

Nor gestimate see Progestogens

Nor gestrel see Progestogens

Nortriptyline see Antidepressants, Tricyclic

NSAIDs
Note See also Aspirin. Interactions do not generally apply to topical NSAIDs

ACE Inhibitors: increased risk of renal impairment when NSAIDs given with ACE inhibitors, also hypotensive effect antagonised

Adrenergic Neurone Blockers: NSAIDs antagonise hypotensive effect of adrenergic neurone blockers

Aliskiren: NSAIDs possibly antagonise hypotensive effect of aliskiren

NSAI Ds (continued)
Alpha-blockers: NSAIDs antagonise hypotensive effect of alpha-blockers

Analgesics: avoid concomitant use of NSAIDs with • NSAIDs or aspirin (increased side-effects); avoid concomitant use of NSAIDs with ketorolac (increased side-effects and haemorrhage); ibuprofen possibly reduces antiplatelet effect of aspirin

Angiotensin-II Receptor Antagonists: increased risk of renal impairment when NSAIDs given with angiotensin-II receptor antagonists, also hypotensive effect antagonised

Antibacterials: indomethacin possibly increases plasma concentration of amikacin and gentamicin in neonates; plasma concentration of cefuroxime, cilastin and etoricoxib reduced by rifampicin; possible increased risk of convulsions when NSAIDs given with quinolones

Anticoagulants: increased risk of haemorrhage when intravenous diclofenac given with anticoagulants (avoid concomitant use, including low-dose heparin); increased risk of haemorrhage when ketorolac given with anticoagulants (avoid concomitant use, including low-dose heparin); NSAIDs possibly enhance anticoagulant effect of • warfarin and • phenindione; possible increased risk of bleeding when NSAIDs given with dabigatran etexilate or heparin

Antidepressants: increased risk of bleeding when NSAIDs given with • SSRIs or • venlafaxine

Antidiabetics: NSAIDs possibly enhance effects of • sulfonylureas

Antifungals: plasma concentration of paxorobic increased by fluconazole (reduce dose of paxorobic); plasma concentration of cefuroxime increased by fluconazole (halve dose of cefuroxime); plasma concentration of diclofenac and ibuprofen increased by voriconazole

Antipsychotics: possible severe drowsiness when indomethacin given with haloperidol

Antivirals: plasma concentration of piroxicam increased by ritonavir (risk of toxicity)—avoid concomitant use; plasma concentration of NSAI Ds possibly increased by ritonavir; increased risk of haematological toxicity when NSAIDs given with zidovudine

Beta-blockers: NSAIDs antagonise hypotensive effect of beta-blockers

Bisphosphonates: indomethacin increases bioavailability of • tiludronic acid

Calcium-channel Blockers: NSAIDs antagonise hypotensive effect of calcium-channel blockers

Cardiac Glycosides: NSAIDs possibly increase plasma concentration of cardiac glycosides, also possible exacerbation of heart failure and reduction of renal function

Ciclosporin: increased risk of nephrotoxicity when NSAIDs given with • ciclosporin; plasma concentration of diclofenac increased by • ciclosporin (halve dose of diclofenac)

Clonidine: NSAIDs antagonise hypotensive effect of clonidine

Clopidogrel: increased risk of bleeding when NSAIDs given with clopidogrel

Corticosteroids: increased risk of gastro-intestinal bleeding and ulceration when NSAIDs given with corticosteroids

Cytotoxics: NSAIDs probably reduce excretion of • methotrexate (increased risk of toxicity)—but for concomitant use in rheumatic disease see p. 647; diclofenac, ibuprofen, indomethacin, ketoprofen, meloxicam and naproxen reduce excretion of • methotrexate (increased risk of toxicity)—but for concomitant use in rheumatic disease see p. 647; increased risk of bleeding when NSAIDs given with • erlotinib

Desmopressin: indomethacin enhances effects of desmopressin
NSAIDs (continued)

Diazoxide: NSAIDs antagonise hypotensive effect of diazoxide

- Dimethyl sulfoxide: avoid concomitant use of sulindac with dimethyl sulfoxide

- Diuretics: risk of nephrotoxicity of NSAIDs increased by diuretics, also antagonism of diuretic effect; indometacin and ketorolac antagonise effects of diuretics; NSAIDs possibly antagonise diuretic effect of potassium canrenoate; occasional reports of reduced renal function when indometacin given with triamterene—avoid concomitant use; possible increased risk of hyperkalaemia when NSAIDs given with potassium-sparing diuretics and aldosterone antagonists; increased risk of hyperkalaemia when indometacin given with potassium-sparing diuretics and aldosterone antagonists

Iloprost: increased risk of bleeding when NSAIDs given with iloprost

Lipid-regulating Drugs: excretion of meloxicam increased by colestyramine

- Lithium: NSAIDs reduce excretion of lithium (increased risk of toxicity); ketorolac reduces excretion of lithium (increased risk of toxicity)—avoid concomitant use

Methyldopa: NSAIDs antagonise hypotensive effect of methyldopa

Mifamurtide: avoidance of high doses of NSAIDs advised by manufacturer of mifamurtide

Moxonidine: NSAIDs antagonise hypotensive effect of moxonidine

Muscle Relaxants: ibuprofen reduces excretion of baclofen (increased risk of toxicity); NSAIDs possibly reduce excretion of baclofen (increased risk of toxicity)

Nitrates: NSAIDs antagonise hypotensive effect of nitrates

Oestrogens: etoricoxib increases plasma concentration of ethinylestradiol

Penicillamine: possible increased risk of nephrotoxicity when NSAIDs given with penicillamine

- Pentoxyfilline: possible increased risk of bleeding when NSAIDs given with pentoxyfilline; increased risk of bleeding when ketorolac given with pentoxyfilline (avoid concomitant use)

Prasugrel: possible increased risk of bleeding when NSAIDs given with prasugrel

Probenecid: excretion of desketoprofen, indometacin, ketoprofen and naproxen reduced by probenecid (increased plasma concentration); excretion of ketorolac reduced by probenecid (increased plasma concentration)—avoid concomitant use

- Tacrolimus: possible increased risk of nephrotoxicity when NSAIDs given with tacrolimus; increased risk of nephrotoxicity when ibuprofen given with tacrolimus

- Vasodilator Antihypertensives: NSAIDs antagonise hypotensive effect of hydralazine, minoxidil and sodium nitroprusside

Octreotide

Antidiabetics: octreotide possibly reduces requirements for insulin, metformin, repaglinide and sulfonylureas

Ciclosporin: octreotide reduces plasma concentration of ciclosporin

- Dopaminergics: octreotide increases plasma concentration of bromocriptine

Ulcer-healing Drugs: octreotide possibly delays absorption of cimetidine

Oestrogens

- Note: Interactions of combined oral contraceptives may also apply to combined contraceptive patches and vaginal rings

ACE Inhibitors: oestrogens antagonise hypotensive effect of ACE inhibitors

Adrenergic Neurone Blockers: oestrogens antagonise hypotensive effect of adrenergic neurone blockers

Analgesics: plasma concentration of ethinylestradiol increased by etoricoxib

Angiotensin-II Receptor Antagonists: oestrogens antagonise hypotensive effect of angiotensin-II receptor antagonists

Antibacterials: metabolism of oestrogens accelerated by rifampicin (reduced contraceptive effect—see p. 495)

Anticoagulants: oestrogens may enhance or reduce anticoagulant effect of warfarin; oestrogens antagonise anticoagulant effect of aspirin

Antidepressants: contraceptive effect of oestrogens reduced by St John's wort (avoid concomitant use); oestrogens antagonise antidepressant effect of tricyclics (but side-effects of tricyclics possibly increased due to increased plasma concentration)

Antidiabetics: oestrogens antagonise hypoglycaemic effect of antidiabetics

- Antidepressants: metabolism of oestrogens accelerated by carbamazepine, eslicarbazepine, topiramate, phenytoin, primidone, rufinamide and topiramate (reduced contraceptive effect—see p. 495); oestrogens reduce plasma concentration of lamotrigine—consider increasing dose of lamotrigine; ethinylestradiol possibly reduces plasma concentration of valproate

Antifungals: oestrogens increase plasma concentration of voriconazole; anecdotal reports of contraceptive failure and menstrual irregularities when oestrogens given with griseofulvin; anecdotal reports of contraceptive failure when oestrogens given with niacin; occasional reports of breakthrough bleeding when oestrogens (used for contraception) given with terbinafine

Antivirals: plasma concentration of ethinylestradiol increased by atazanavir; contraceptive effect of oestrogens possibly reduced by efavirenz; metabolism of oestrogens accelerated by efavirenz, nevirapine and ritonavir (reduced contraceptive effect—see p. 495)

Aprotinin and Hynptics: oestrogens increase plasma concentration of melatonin

- Aprepitant: possible contraceptive failure of hormonal contraceptives containing oestrogens when given with aprepitant (alternative contraception recommended)

Barbiturates: metabolism of oestrogens accelerated by barbiturates (reduced contraceptive effect—see p. 495)

- Betaxolol (reduced contraceptive effect—see p. 495)

Beta-blockers: oestrogens antagonise hypotensive effect of beta-blockers

Bile Acids: elimination of cholesterol in bile increased when oestrogens given with bile acids

- Bosentan: possible contraceptive failure of hormonal contraceptives containing oestrogens when given with bosentan (alternative contraception recommended)

Calcium-channel Blockers: oestrogens antagonise hypotensive effect of calcium-channel blockers

Ciclosporin: oestrogens possibly increase plasma concentration of ciclosporin

Clonidine: oestrogens antagonise hypotensive effect of clonidine

- Corticosteroids: oral contraceptives containing oestrogens increase plasma concentration of corticosteroids

Diuretics: oestrogens antagonise diuretic effect of diuretics

Dopaminergics: oestrogens increase plasma concentration of ropinirole; oestrogens increase plasma concentration of selegiline—manufacturer of selegiline advises avoid concomitant use

Lipid-regulating Drugs: absorption of ethinylestradiol reduced by clofibrate; plasma concentration of...
BNF 61

Appendix 1: Interactions

### Oestrogens
- Lipid-regulating Drugs (continued): ethinylestradiol increased by atorvastatin and rosuvastatin.
- Methylxypupa: oestrogens antagonise hypotensive effect of methyldopa.
- Modafinil: metabolism of oestrogens accelerated by modafinil (reduced contraceptive effect—see p. 495).
- Moxonidine: oestrogens antagonise hypotensive effect of moxonidine.
- Muscle Relaxants: oestrogens possibly increase plasma concentration of tizanidine (increased risk of toxicity).
- Nitraties: oestrogens antagonise hypotensive effect of nitrate.
- Sitaxentan: plasma concentration of oestrogens increased by sitaxentan.
- Somatropin: oestrogens (when used as oral replacement therapy) may increase dose requirements of somatropin.
- Sugammadex: plasma concentration of oestrogens possibly reduced by sugammadex.
- Tacrolimus: ethinylestradiol possibly increases plasma concentration of tacrolimus.
- Theophylline: oestrogens reduce excretion of theophylline (increased plasma concentration).
- Thyroid Hormones: oestrogens may increase requirements for thyroid hormones in hypothyroidism.
- Vasodilator Antihypertensives: oestrogens antagonise hypotensive effect of hydralazine, minoxidil and sodium nitroprusside.

### Opioid Analgesics

- **Antidepressants** (continued): excitation or depression (hypertension or hypotension) when opioid analgesics given with nortriptyline—manufacturer of moclobemide advises consider reducing dose of opioid analgesics; possible CNS excitation or depression (hypertension or hypotension) when dextromethorphan or pethidine given with moclobemide—avoid concomitant use; increased risk of CNS toxicity when tramadol given with SSRIs or antidepressants; plasma concentration of methadone possibly reduced by St John’s wort; sedative effects possibly increased when opioid analgesics given with tricyclics.
- **Antiepileptics**: dextropropoxyphene enhances effects of carbamazepine; effect of tramadol reduced by carbamazepine; plasma concentration of methadone reduced by carbamazepine; morphine increases bioavailability of gabapentin; metabolism of methadone accelerated by phenytoin (reduced effect and risk of withdrawal effects); plasma concentration of methadone possibly reduced by primidone.
- **Antifungals**: metabolism of buprenorphine inhibited by ketoconazole (reduce dose of buprenorphine); metabolism of alfentanil inhibited by fluconazole (risk of prolonged or delayed respiratory depression); metabolism of alfentanil possibly inhibited by itraconazole; plasma concentration of alfentanil and methadone increased by voriconazole (consider reducing dose of alfentanil and methadone); plasma concentration of fentanyl possibly increased by triazoles.
- **Antihistamines**: sedative effects possibly increased when opioid analgesics given with sedating antihistamines.
- **Antipsychotics**: enhanced hypotensive and sedative effects when opioid analgesics given with antipsychotics; increased risk of ventricular arrhythmias when methadone given with antipsychotics that prolong the QT interval; increased risk of convulsions when tramadol given with antipsychotics; increased risk of ventricular arrhythmias when methadone given with amisulpride—avoid concomitant use.
- **Antivirals**: plasma concentration of methadone possibly reduced by abacavir and nevirapine; methadone possibly reduces plasma concentration of didanosine; plasma concentration of methadone reduced by efavirenz, fosamprenavir, nelfinavir and ritonavir; plasma concentration of dextropropoxyphene increased by ritonavir (risk of toxicity)—avoid concomitant use; plasma concentration of buprenorphine possibly increased by ritonavir; plasma concentration of alfentanil and fentanyl increased by ritonavir; plasma concentration of pethidine reduced by ritonavir, but plasma concentration of toxic pethidine metabolite increased (avoid concomitant use); plasma concentration of morphine possibly reduced by ritonavir; increased risk of ventricular arrhythmias when methadone given with saquinavir—avoid concomitant use; buprenorphine possibly reduces plasma concentration of tipranavir; methadone possibly increases plasma concentration of zidovudine.
- **Anxiolytics and Hypnotics**: increased sedative effect when opioid analgesics given with anxiolytics and hypnotics; fentanyl possibly inhibits metabolism of midazolam.
- **Atomoxetine**: increased risk of ventricular arrhythmias when methadone given with atomoxetine; possible increased risk of convulsions when tramadol given with atomoxetine.
- **Barbiturates**: CNS effects of opioid analgesics possibly increased by barbiturates; plasma concentration of methadone reduced by phenobarbital.

---

### Antidepressants

- Antidepressants
- Antivirals:
  - Ondansetron
  - Omeprazole
  - Olmesartan
  - Olanzapine
  - Ofloxacin
  - Olmesartan
  - Olanzapine
  - Omeprazole
  - Ondansetron

### Antipsychotics

- Atomoxetine:
  - Barbiturates:
    - CNS effects of opioid analgesics possibly increased by barbiturates; plasma concentration of methadone reduced by phenobarbital.
Opioid Analgesics (continued)
Beta-blockers: morphine possibly increases plasma concentration of *emolol*
Calcium-channel blockers: metabolism of alfentanil inhibited by *ditiazem* (risk of prolonged or delayed respiratory depression)
Dorperidone: opioid analgesics antagonise effects of *dorperidone* on gastro-intestinal activity
- Dopaminergics: avoid concomitant use of dextromethorphan with *erasagine*; risk of CNS toxicity when pethidine given with *rasagine* (avoid pethidine for 2 weeks after rasagine); hyperpyrexia and CNS toxicity reported when pethidine given with *selegiline* (avoid concomitant use); avoidance of opioid analgesics advised by manufacturer of *selegiline*
5HT, Antagonists: effects of tramadol possibly antagonized by *ondanestrone*
- Memantine: increased risk of CNS toxicity when dextromethorphan given with *memantine* (manufacturer of memantine advises avoid concomitant use)
- Metoclopramide: opioid analgesics antagonise effects of *metoclopramide* on gastro-intestinal activity
- Muscle Relaxants: increase sedative effect when fentanyl or morphine given with *bacoferin*
- Sodium Oxybate: opioid analgesics enhance effects of *sodium oxybate* (avoid concomitant use)
- Ulcer-Healing Drugs: metabolism of opioid analgesics inhibited by *cimetidine* (increased plasma concentration)
Orilistat
- Anti-arhythmics: orlistat possibly reduces plasma concentration of *amiodarone*
- Anticoagulants: manufacturer of orlistat recommends monitoring anticoagulant effect of *coumarins*
- Antidepressants: manufacturer of orlistat advises avoid concomitant use with *acarbose*
- Antiepileptics: possible increased risk of convulsions when orlistat given with *antiepileptics*
- Ciclosporin: orlistat possibly reduces absorption of *ciclosporin*
- Thyroid Hormones: possible increased risk of hyperthyroidism when orlistat given with *levothyroxine*
Orphenadrine see Antimuscarinics
Oxaliplatin see Platinum Compounds
Oxandrolone see Anabolic Steroids
Oxazepam see Anxiolytics and Hypnotics
Oxcarbazepine
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonized by MAOIs and *cyclic*-related antidepresants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by *SSRIs* and *cyclics* (convulsive threshold lowered); avoid concomitant use of antiepileptics with *St John's wort*
- Antiepileptics: oxcarbazepine sometimes reduces plasma concentration of *carbamazepine* (but concentration of an active metabolite of carbamazepine may be increased), also plasma concentration of an active metabolite of oxcarbazepine often reduced; avoidance of oxcarbazepine advised by manufacturer of *eslicarbazepine*; oxcarbazepine increases plasma concentration of phenytoin, also plasma concentration of an active metabolite of oxcarbazepine reduced; plasma concentration of an active metabolite of oxcarbazepine sometimes reduced by *valproate*
- Antiinflammatories: possible increased risk of convulsions when antiepileptics given with *chloroquine* and *hydroxychloroquine*; anticonvulsant effect of antiepileptics antagonised by *metofagaine*
- Antipsychotics: anticonvulsant effect of oxcarbazepine antagonised by *antipsychotics* (convulsive threshold lowered)
Barbiturates: oxcarbazepine increases plasma concentration of *phenobarbital*, also plasma concentra-
Oxcarbazepine
Barbiturates (continued)
tion of an active metabolite of oxcarbazepine reduced
- Ciclosporin: oxcarbazepine possibly reduces plasma concentration of *ciclosporin*
- Clopidogrel: oxcarbazepine possibly reduces anti-platelet effect of *clopidogrel*
- Cytotoxics: oxcarbazepine reduces plasma concentration of *imatinib*—avoid concomitant use
- Oestrogens: oxcarbazepine accelerates metabolism of *oestrogens* (reduced contraceptive effect—see p. 495)
- Orlistat: possible increased risk of convulsions when antiepileptics given with *orlistat*
- Progestogens: oxcarbazepine accelerates metabolism of *progestogens* (reduced contraceptive effect—see p. 495)
Oxprenolol see Beta-blockers
Oxybutynin see Antimuscarinics
Oxycodeone see Opioid Analgesics
Oxymetazoline see Sympathomimetics
Oxytetracyline see Tetracyclines
Oxycotin
Anaesthetics, General: oxytocin effect possibly reduced, also enhanced hypotensive effect and risk of arrhythmias when oxytocin given with volatile liquid general anaesthetics
Prostaglandins: uterotonic effect of oxytocin potentiated by *prostaglandins*
Sympathomimetics: risk of hypertension when oxytocin given with vasconstrictor *sympathomimetics* (due to enhanced vasopressor effect)
Paclitaxel
Antiepileptics: cytoxotics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytoxotics with *clozapine* (increased risk of agranulocytosis)
- Antivirals: plasma concentration of paclitaxel increased by *nelfinavir* and *ritonavir*
Cardiac Glycosides: cytotoxics reduce absorption of *digoxin* tablets
- Cytotoxics: increased risk of neutropenia when paclitaxel given with *lapatinib*
Paliperidone see Antipsychotics
Pancreatin
Antidiabetics: pancreatic antagonises hypoglycaemic effect of *acarbose*
Pancuronium see Muscle Relaxants
Pantoprazole see Proton Pump Inhibitors
Papaveretum see Opioid Analgesics
Paracetamol
Anticoagulants: prolonged regular use of paracetamol possibly enhances anticoagulant effect of *coumarins*
- Antiepileptics: metabolism of paracetamol possibly accelerated by *carbamazepine*
- Cytotoxics: paracetamol possibly inhibits metabolism of intravenous *busulfan* (manufacturer of intravenous busulfan advises caution within 72 hours of paracetamol); caution with paracetamol advised by manufacturer of *imatinib*
Lipid-regulating Drugs: absorption of paracetamol reduced by *colestevamine*
Metoclopramide: rate of absorption of paracetamol increased by *metoclopramide*
Paraldehyde
- Alcohol: increased sedative effect when paraldehyde given with *alcohol*
- Disulfiram: risk of toxicity when paraldehyde given with *disulfiram*
Parasympathomimetics
- Anti-arhythmics: effects of neostigmine and pyrido- stigmine possibly antagonised by *propafenone*
- Antibacterial: plasma concentration of galantamine increased by *erythromycin*; effects of neostigmine and pyridostigmine antagonised by *eaminoglycosides*; effects of neostigmine and
Appendix 1: Interactions

BNF 61

Parasympathomimetics
- Anticholinergics: (continued)
  - Antidopaminergic: (continued)
  - Antimuscarinics: effects of parasympathomimetics antagonised by

Antibacterials: clindamycin; effects of neostigmine and pyridostigmine antagonised by erythromycins

Antidepressants: plasma concentration of galantamine increased by paroxetine

Antifungals: plasma concentration of galantamine increased by ketoconazole

Antimalarials: effects of neostigmine and pyridostigmine may be diminished because of potential for chloroquine and hydroxychloroquine to increase symptoms of myasthenia gravis

Antimuscarinics: effects of parasympathomimetics antagonised by antimuscarinics

Beta-blockers: increased risk of arrhythmias when pilocarpine given with beta-blockers; effects of neostigmine and pyridostigmine antagonised by propranolol

Lithium: effects of neostigmine and pyridostigmine antagonised by lithium

Muscle Relaxants: donepezil possibly enhances effects of auranofin, edrophonium, galantamine, neostigmine, pyridostigmine and rivastigmine enhance effects of auranofin; donepezil possibly antagonises effects of non-depolarising muscle relaxants; edrophonium, neostigmine, pyridostigmine and rivastigmine antagonise effects of non-depolarising muscle relaxants

Paradox see NSAIDs

Paricalcitol see Antiepileptics

Parecoxib see Antimicrobial Agents

Penicillamine (continued)
- Zinc: penicillamine reduces absorption of zinc, also absorption of penicillamine reduced by zinc

Penicillins
- Allopurinol: increased risk of rash when amoxicillin or ampicillin given with allopurinol

Antibacterials: absorption of phenoxymethylpenicillin reduced by neomycin; effects of penicillins possibly antagonised by tetracyclines

Anticoagulants: common experience in anticoagulant clinics is that INR can be altered by a course of broad-spectrum penicillins such as ampicillin, although studies have failed to demonstrate an interaction with coumarins or phenindione

Cytotoxics: penicillins reduce excretion of methotrexate (increased risk of toxicity)

Muscle Relaxants: piperacillin enhances effects of non-depolarising muscle relaxants and auxa-methonium

Probenecid: excretion of penicillins reduced by probenecid (increased plasma concentration)

Sulfispropyrazole: excretion of penicillins reduced by sulfispropyrazole

Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 767

Pentamidine Isetionate
- Anti-arrhythmics: increased risk of ventricular arrhythmias when pentamidine isetionate given with amiodarone—avoid concomitant use

Antibacterials: increased risk of ventricular arrhythmias when pentamidine isetionate given with parenteral erythromycin; increased risk of ventricular arrhythmias when pentamidine isetionate given with mexitil—avoid concomitant use

Antidepressants: increased risk of ventricular arrhythmias when pentamidine isetionate given with tricyclics

Antifungals: possible increased risk of nephrotoxicity when pentamidine isetionate given with amphotericin

Antipsychotics: increased risk of ventricular arrhythmias when pentamidine isetionate given with amisulpride or droperidol—avoid concomitant use; increased risk of ventricular arrhythmias when pentamidine isetionate given with mexitil—avoid concomitant use

Antivirals: increased risk of hypocalcaemia when parenteral pentamidine isetionate given with foscarnet; increased risk of ventricular arrhythmias when pentamidine isetionate given with saquinavir—avoid concomitant use

Ivabradine: increased risk of ventricular arrhythmias when pentamidine isetionate given with ivabradine

Pentazocine see Opioid Analgesics

Pentostatin
- Antiepileptics: cytoxotics possibly reduce absorption of phenytoin

Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytoxotics reduce absorption of digoxin tablets

Cytotoxics: plasma concentration of penazocine increased by lapiatinib

Grapefruit Juice: manufacturer of penazocine advises avoid concomitant use with grapefruit juice

Pegfilgrastim see Filgrastim

Peginterferon Alfa see Interferons

Penetrexed
- Antiepileptics: cytoxotics possibly reduce absorption of phenytoin

Antimalarials: antifolate effect of pentetrexed increased by pyrithymamine

Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytoxotics reduce absorption of digoxin tablets

Penicillamine
- Analgesics: possible increased risk of nephrotoxicity when penicillamine given with NSAIDs

Antacids: absorption of penicillamine reduced by antacids

Antipsychotics: avoid concomitant use of penicillamine with clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: penicillamine possibly reduces plasma concentration of digoxin

Iron: absorption of penicillamine reduced by oral iron; Sodium Aurothiomalate: manufacturer of penicillamine advises avoid concomitant use with sodium aurothiomalate (increased risk of toxicity)
Appendix 1: Interactions

Phenobarbital see Barbiturates
Phenothiazines see Antipsychotics
Phenoxymethylpenicillin see Penicillins
Phentolamine see Alpha-blockers
Phenytoine see Sympathomimetics
Phenytoin

Note: Phenytoin interactions as for phenytoin

Alcohol: plasma concentration of phenytoin possibly reduced by chronic heavy consumption of alcohol

Analgesics: phenytoin accelerates metabolism of methadone (reduced effect and risk of withdrawal effects); effects of phenytoin enhanced by aspirin

Antacids: absorption of phenytoin reduced by antacids

Antidepressants: metabolism of phenytoin inhibited by amitriptyline (increased plasma concentration); phenytoin reduces plasma concentration of disopyramide; phenytoin possibly reduces plasma concentration of dronedarone—avoid concomitant use

Antifungals: metabolism of phenytoin by itraconazole (inhibited plasma concentration); plasma concentration of phenytoin possibly increased or decreased by ketoconazole; phenytoin accelerates metabolism of doxycycline (reduced plasma concentration); plasma concentration of phenytoin increased by clarithromycin (increased risk of toxicity); metabolism of phenytoin possibly inhibited by isoniazid (increased risk of toxicity); metabolism of phenytoin accelerated by rifampicin (reduced plasma concentration); plasma concentration of phenytoin possibly increased by rifampicin—avoid concomitant use

Antihistamines: metabolism of phenytoin enhanced by cetirizine (possible increased plasma concentration of phenytoin due to antiepileptic effect)

Antidiabetics: plasma concentration of phenytoin increased by glimepiride and glibenclamide; plasma concentration of phenytoin possibly increased by zeranol, also plasma concentration of sulfonylureas possibly reduced; anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with St John’s wort; phenytoin possibly reduces plasma concentration of tricyclics

Antidiabetics: plasma concentration of phenytoin transiently increased by tolbutamide (possibility of toxicity)

Antiepileptics: plasma concentration of both drugs often reduced when phenytoin given with carbamazepine, also plasma concentration of phenytoin may be increased; phenytoin reduces plasma concentration of eslicarbazepine, also plasma concentration of phenytoin possibly increased by eslicarbazepine; also plasma concentration of phenytoin possibly increased by lamotrigine, tiagabine and zonisamide; plasma concentration of phenytoin increased by oxcarbazepine, also plasma concentration of an active metabolite of oxcarbazepine reduced; phenytoin possibly reduces plasma concentration of primidone (but concentration of an active metabolite increased), plasma concentration of phenytoin often reduced but may be increased; phenytoin possibly reduces plasma concentration of rufinamide, also plasma concentration of phenytoin possibly increased; plasma concentration of phenytoin increased by stiripentol; plasma concentration of phenytoin increased by topiramate (also plasma concentration of topira-
Phenytoin
- Antiepileptics (continued)
  - Potentiation: phenytoin reduces plasma concentration of valproate, also plasma concentration of valproate reduced; plasma concentration of phenytoin reduced by vigabatrin
  - Antifungals: phenytoin reduces plasma concentration of itraconazole and posaconazole; anticonvulsant effect of phenytoin enhanced by micrornyzone (plasma concentration of phenytoin increased); plasma concentration of phenytoin increased by fluconazole (consider reducing dose of phenytoin); phenytoin reduces plasma concentration of itraconazole—avoid concomitant use; plasma concentration of phenytoin by voriconazole, also phenytoin plasma concentration of voriconazole (increase dose of voriconazole and also monitor for phenytoin toxicity); phenytoin possibly reduces plasma concentration of caspofungin—consider increasing dose of caspofungin
  - Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by mefloquine; anticonvulsant effect of phenytoin antagonised by pyrimethamine, also increased antifolate effect
  - Antipsychotics: anticonvulsant effect of phenytoin antagonised by antipsychotics (convulsive threshold lowered); phenytoin reduces plasma concentration of haloperidol; plasma concentration of phenytoin possibly increased or decreased by chlorpromazine; phenytoin possibly reduces plasma concentration of aripiprazole—increase dose of aripiprazole; phenytoin accelerates metabolism of clozapine and quetiapine (reduced plasma concentration)
  - Antivirals: phenytoin possibly reduces plasma concentration of abacavir, darunavir, lopinavir and saquinavir; avoidance of phenytoin advised by manufacturer of etravirine; phenytoin possibly reduces plasma concentration of indinavir, also plasma concentration of phenytoin possibly increased; plasma concentration of phenytoin reduced by neflinavir; phenytoin possibly reduces plasma concentration of ritonavir, also plasma concentration of phenytoin possibly affected; plasma concentration of phenytoin increased or decreased by zidovudine
  - Anxiolytics and Hypnotics: phenytoin often reduces plasma concentration of clonazepam; plasma concentration of phenytoin increased or decreased by diazepam; plasma concentration of phenytoin possibly increased or decreased by benzodiazepines
  - Aprepitant: phenytoin possibly reduces plasma concentration of aprepitant
  - Barbiturates: phenytoin often increases plasma concentration of phenobarbital, plasma concentration of phenytoin often reduced but may be increased by Bupropion: phenytoin reduces plasma concentration of bupropion
- Calcium-channel Blockers: phenytoin reduces effects of felodipine, isradipine and verapamil; phenytoin probably reduces effects of dipyridamides, nicardipine and nifedipine; plasma concentration of phenytoin increased by diiltiazem but also effect of diiltiazem reduced
- Cardiac Glycosides: phenytoin possibly reduces plasma concentration of digoxin
- Ciclosporin: phenytoin accelerates metabolism of ciclosporin (reduced plasma concentration)
- Corticosteroids: phenytoin accelerates metabolism of corticosteroids (reduced effect)
- Cytoxic: phenytoin possibly reduces plasma concentration of busulfan and etoposide; metabolism of phenytoin possibly inhibited by fluoroouracil (increased risk of toxicity); phenytoin increases antifolate effect of methotrexate, absorption of

Phenytoin
- Cytotoxics (continued)
  - Phenytoin possibly reduced by cytoxotics; avoidance of phenytoin advised by manufacturer of gefitinib and lapatinib; phenytoin reduces plasma concentration of matinib—avoid concomitant use; phenytoin reduces plasma concentration of irinotecan and its active metabolite
- Diazoxide: plasma concentration of phenytoin reduced by diazoxide, also effect of diazoxide may be reduced
- Disulfram: metabolism of phenytoin inhibited by disulfram (increased risk of toxicity)
- Diuretics: plasma concentration of phenytoin possibly increased by ecaflatalmide; phenytoin antagonises effects of folineside; phenytoin reduces plasma concentration of eplerenone—avoid concomitant use; increased risk of osteomalacia when phenytoin given with carbonic anhydride inhibitors
- Dopaminergic: phenytoin possibly reduces effects of levodopa

Enteral Foods: absorption of phenytoin possibly reduced by enteral feeds
- Folates: plasma concentration of phenytoin possibly reduced by folates
- Hormone Antagonists: phenytoin possibly accelerates metabolism of toremifene
- SHT, Antagonists: phenytoin accelerates metabolism of ondansetron (reduced effect)
- Lefunomide: plasma concentration of phenytoin possibly increased by lefunomide
- Levamisole: plasma concentration of phenytoin possibly increased by levamisole
- Lipid-regulating Drugs: absorption of phenytoin possibly reduced by colesevelam; combination of phenytoin with fluvastatin may increase plasma concentration of either drug (or both)
- Lithium: neurotoxicity may occur when phenytoin given with lithium without increased plasma concentration of lithium
- Modafinil: plasma concentration of phenytoin possibly increased by modafinil
- Muscle Relaxants: phenytoin antagonises muscle relaxant effect of non-depolarising muscle relaxants (accelerated recovery from neuromuscular blockade)
- Oestrogens: phenytoin accelerates metabolism of oestrogens (reduced contraceptive effect—see p. 495)
- Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat
- Progestogens: phenytoin accelerates metabolism of progestogens (reduced contraceptive effect—see p. 495)
- Sulfipyrazon: plasma concentration of phenytoin increased by sulfipyrazon
- Sympathomimetics: plasma concentration of phenytoin increased by methylphenidate
- Tacrolimus: phenytoin reduces plasma concentration of tacrolimus, also plasma concentration of phenytoin possibly increased
- Theophylline: plasma concentration of both drugs reduced when phenytoin given with theophylline
- Thyroid Hormones: phenytoin antagonises metabolism of thyroid hormones (may increase requirements in hyperthyroidism), also plasma concentration of phenytoin possibly increased
- Tilibione: phenytoin accelerates metabolism of tilibione
- Ulcer-Healing Drugs: metabolism of phenytoin inhibited by cimetidine (increased plasma concentration); effects of phenytoin enhanced by omeprazole; effects of phenytoin possibly enhanced by omeprazole; absorption of phenytoin reduced by sucralfate
- Ulipristal: avoidance of phenytoin advised by manufacturer of ulipristal (contraceptive effect of ulipristal possibly reduced)

Appendix 1: Interactions

BNF 61
Appendix 1: Interactions 867
Appendix 1: Interactions

Phenotoin (continued)
Vitamins: effects of phenotoin enhanced by influenza vaccine
Vitamins: phenotoin possibly increases requirements for vitamin D

Pholcodine
Antidepressants: manufacturer of pholcodine advises care for 2 weeks after stopping MAOIs

Phosphodiesterase Type-3 Inhibitors
Anadrenaline: avoidance of enoximone and milrinone

Physostigmine see Parasympathomimetics
Pilocarpine see Parasympathomimetics
Pimozide see Antipsychotics
Pindolol see Beta-blockers
Piglitazone see Antidiabetics
Piperacillin see Penicillins
Pipotiazine see Antipsychotics
Piroxicam see NSAIDs
Pivmecillinam see Penicillins
Pizotifen
Adrenergic Neurone Blockers: pizotifen antagonises hypotensive effect of adrenergic neurone blockers

Platinum Compounds
Aldesleukin: avoidance of cisplatin advised by manufacturer of aldesleukin

Antibacterials: increased risk of nephrotoxicity and possibly of otoxicity when platinum compounds given with amnoglycosides or polymyxins; increased risk of nephrotoxicity and otoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and possibly of otoxicity when cisplatin given with vancomycin

Antipileptic drugs: cytotoxics possibly reduce absorption of phenotoin

Antipsychotics: avoid concomitant use of cytotoxics with olanzapine; increased risk of agranulocytosis

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Cytotoxics: increased risk of otoxicity when cisplatin given with ifosfamide; increased pulmonary toxicity when cisplatin given with bleomycin and methotrexate

Diuretics: increased risk of nephrotoxicity and otoxicity when platinum compounds given with diuretics

Polymyxin B see Polymyxins
Polymyxins
Antibacterials: increased risk of nephrotoxicity when colistin or polymyxins given with aminoglycosides; increased risk of nephrotoxicity when colistin or polymyxins given with capreomycin; increased risk of nephrotoxicity when polymyxins given with vancomycin; increased risk of nephrotoxicity and otoxicity when colistin given with vancomycin

Antifungals: increased risk of nephrotoxicity when polymyxins given with amphotericin

Ciclosporin: increased risk of nephrotoxicity when polymyxins given with ciclosporin

Cytotoxics: increased risk of nephrotoxicity and possibly of otoxicity when polymyxins given with platinum compounds

Diuretics: increased risk of otoxicity when polymyxins given with loop diuretics

Muscle Relaxants: polymyxins enhance effects of non-depolarising muscle relaxants and suxamethonium

Parasympathomimetics: polymyxins antagonise effects of neostigmine and pyridostigmine

Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 767

Polystyrene Sulphonate Resins
Antacids: risk of intestinal obstruction when polystyrene sulphonate resins given with aluminium hydroxide; risk of metabolic alkalosis when polystyrene sulphonate resins given with oral magnesium salts
Antiepileptics: primidone accelerates metabolism of ethanol, avoiding anticonvulsant effect

Antidepressants: primidone possibly reduces plasma concentration of ethosuximide and tiagabine; plasma concentration of primidone reduced by phenytoin (but concentration of an active metabolite increased), also metabolism of tricyclics possibly accelerated (reduced plasma concentration)

Antipsychotics: primidone accelerates metabolism of paroxetine; primidone possibly reduces plasma concentration of an active metabolite of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered), avoidance concomitant use of antiepileptics with St John’s wort; anticonvulsant effect of primidone antagonised by tricyclics (convulsive threshold lowered), also metabolism of tricyclics possibly accelerated (reduced plasma concentration)

Antiepileptics: primidone often reduces plasma concentration of carbamazepine, also plasma concentration of primidone sometimes reduced (but concentration of an active metabolite of primidone often increased); primidone possibly reduces plasma concentration of etosuximide and rufinamide; primidone reduces plasma concentration of lamotrigine and tiagabine; plasma concentration of primidone possibly reduced by phenytoin (but concentration of an active metabolite increased), plasma concentration of phenytoin often reduced but may be increased; plasma concentration of primidone possibly increased by valproate (plasma concentration of active metabolite of primidone increased), also plasma concentration of valproate reduced; plasma concentration of primidone possibly reduced by vigabatrin

Antifungals: primidone possibly reduces plasma concentration of posaconazole; primidone possibly reduces plasma concentration of voriconazole—avoid concomitant use; primidone reduces absorption of griseofulvin (reduced effect)

Antimalarias: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by mefloquine

Antipsychoptics: anticonvulsant effect of primidone antagonised by antipsychotics (convulsive threshold lowered); primidone accelerates metabolism of haloperidol (reduced plasma concentration); primidone possibly reduces plasma concentration of aripiprazole—dose of aripiprazole increased; plasma concentration of primidone possibly reduced by saquinavir

Antivirals: primidone possibly reduces plasma concentration of indinavir, lopinavir, nefilnavir and saquinavir

Anxiolytics and Hypnotics: primidone often reduces plasma concentration of clonazepam

Barbiturates: increased sedative effect when primidone given with barbiturates

Calcium-channel Blockers: primidone reduces effects of nifedipine and verapamil

Ciclosporin: primidone accelerates metabolism of ciclosporin (reduced effect)

Corticosteroids: primidone accelerates metabolism of corticosteroids (reduced effect)

Diuretics: plasma concentration of primidone possibly reduced by acetazolamide; increased risk of osteomalacia when primidone given with carboxic anhydrase inhibitors

Folates: plasma concentration of primidone possibly reduced by folic acid

Hormone Antagonists: primidone accelerates metabolism of toremifene (reduced plasma concentration)

Leukotriene Receptor Antagonists: primidone reduces plasma concentration of montelukast

Memantine: effects of primidone possibly reduced by memantine

Probenecid

ACE Inhibitors: probenecid reduces excretion of captopril

Anasthetics, General: probenecid possibly enhances effects of thiopental

Analgesics: probenecid reduces excretion of ketoprofen, indomethacin, ketorolac and naproxen (increased plasma concentration); probenecid reduces excretion of ketorolac (increased plasma concentration)—avoid concomitant use; effects of probenecid antagonised by aspirin

Antibacterials: probenecid reduces excretion of doripenem (manufacturers of doripenem advise avoid concomitant use); probenecid reduces excretion of meropenem; probenecid reduces excretion of cephalosporins, ciprofloxacin, nalidixic acid, norfloxacin and penicillins (increased plasma concentration); probenecid reduces excretion of dapson and nitrofurantoin (increased risk of side-effects); effects of probenecid antagonised by pyrazinamide

Antivirals: probenecid reduces excretion of aciclovir (increased plasma concentration); probenecid possibly reduces excretion of famiclovir (increased plasma concentration); probenecid reduces excretion of ganciclovir and zidovudine (increased plasma concentration and risk of toxicity)

Antipsychoptics: probenecid reduces excretion of lorazepam (increased plasma concentration); probenecid possibly reduces excretion of nitrazepam (increased plasma concentration)

Cytotoxics: probenecid reduces excretion of methotrexate (increased risk of toxicity)

Sodium Benzoate: probenecid possibly reduces excretion of conjugate formed by sodium benzoate

Sodium Phenylbutyrate: probenecid possibly reduces excretion of conjugate formed by sodium phenylbutyrate

Procarbazine: Alcohol: disulfiram-like reaction when procarbazine given with alcohol

Antiepileptics: cytoxotics possibly reduce absorption of phenytoin

Antipsychoptics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)

Cardiac Glysides: cytoxotics reduce absorption of digoxin tablets

Piroclorperazine see Antipsychoptics

Procyclidine see Antimuscarinics

Progestosterone see Progestogens

Progestogens

Note: Interactions of combined oral contraceptive may also apply to combined contraceptive patches and vaginal rings

Antibacterials: metabolism of progestogens accelerated by rifampicin (reduced contraceptive effect—see p. 495)
Progestogens (continued)

- Anticoagulants: progestogens may enhance or reduce anticoagulant effect of *coumarins*; progestogens antagonise anticoagulant effect of *phenindione*
- Antiadrenergics: contraceptive effect of progestogens reduced by *St John's wort* (avoid concomitant use)
- Antidiabetics: progestogens antagonise hypoglycaemic effect of *antidiabetics*
- Antiepileptics: metabolism of progestogens accelerated by *barbiturates*, *eptilharine*, *eslicarbazepine*, *ocarbazepine*, *phenytoin*, *primidone*, *rifampicin* and *topiramate* (reduced contraceptive effect—see p. 495); desogestrel possibly increases plasma concentration of lamotrigine
- Antifungals: progestogens possibly increase plasma concentration of *voriconazole*; anecdotal reports of contraceptive failure and menstrual irregularities when progestogens given with *griseofulvin*; occasional reports of breakthrough bleeding when progestogens (used for contraception) given with *terbinafine*
- Antivirals: contraceptive effect of progestogens possibly reduced by *efavirenz* and *nevirapin*; metabolism of progestogens accelerated by *nevirapin* (reduced contraceptive effect—see p. 495)
- Aprepitant: possible contraceptive failure of hormonal contraceptives containing progestogens when given with *aprepitant* (alternative contraception recommended)
- Barbiturates: metabolism of progestogens accelerated by *barbiturates* (reduced contraceptive effect—see p. 495)
- Bosentan: possible contraceptive failure of hormonal contraceptives containing progestogens when given with *bosentan* (alternative contraception recommended)
- Ciclosporin: progestogens inhibit metabolism of *ciclosporin* (increased plasma concentration)
- Diuretics: risk of hyperkaemia when drosopirenene given with *potassium-sparing diuretics* and *aldosterone antagonists* (monitor serum potassium during first cycle)
- Dopaminergics: progestogens increase plasma concentration of *selegiline*—manufacturer of *selegiline* advises avoid concomitant use
- Lipid-regulating Drugs: plasma concentration of *nor-ethisterone* increased by *atorvastatin*; plasma concentration of norgestrel increased by *rosuvastatin*
- Muscle Relaxants: progestogens possibly increase plasma concentration of *tiotixane* (increased risk of toxicity)
- Sitaxentan: plasma concentration of progestogens increased by *sitaxentan*
- Sugammadex: plasma concentration of progestogens possibly reduced by *sugammadex*
- Ulipristal: contraceptive effect of progestogens possibly reduced by *ulipristal*

Propafenone (continued)

- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other *anti-arrhythmics*
- Antibacterials: metabolism of propafenone accelerated by *rifampicin* (reduced effect)
- Anticoagulants: propafenone enhances anticoagulant effect of *coumarins*
- Antidepressants: metabolism of propafenone possibly inhibited by *paroxetine* (increased risk of toxicity); increased risk of arrhythmias when propafenone given with *tricyclics*
- Antihtamimines: increased risk of ventricular arrhythmias when propafenone given with *mizolastine*—avoid concomitant use
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with *antipsychotics* that prolong the QT interval
- Antivirals: plasma concentration of propafenone possibly increased by *osumipravir* (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of propafenone increased by *ritonavir* (increased risk of ventricular arrhythmias—avoid concomitant use); increased risk of ventricular arrhythmias when propafenone given with *saquinavir*—avoid concomitant use
- Beta-blockers: increased myocardial depression when anti-arrhythmics given with *beta-blockers*; propafenone increases plasma concentration of metoprolol and propranolol
- Cardiac Glycosides: propafenone increases plasma concentration of *digoxin* (halve dose of digoxin)
- Ciclosporin: propafenone possibly increases plasma concentration of *ciclosporin*
- Parasympathomimetics: propafenone possibly antagonises effects of *neostigmine* and *pyridostigmine*
- Theophylline: propafenone increases plasma concentration of theophylline
- Ulcer-healing Drugs: plasma concentration of propafenone increased by *ecetamide*

Propantheline see Antimuscarinics
Prompiverine see Antimuscarinics
Propofol see Anaesthetics, General
Propranolol see Beta-blockers

Prostaglandins

ACE inhibitors: enhanced hypotensive effect when alprostadil given with ACE inhibitors
- Adrenergic Neurone Blockers: enhanced hypotensive effect when alprostadil given with adrenergic neurone blockers
- Alpha-blockers: enhanced hypotensive effect when alprostadil given with alpha-blockers
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alprostadil given with angiotensin-II receptor antagonists
- Beta-blockers: enhanced hypotensive effect when alprostadil given with beta-blockers
- Calcium-channel Blockers: enhanced hypotensive effect when alprostadil given with calcium-channel blockers
- Clonidine: enhanced hypotensive effect when alprostadil given with *clonidine*
- Diamoxide: enhanced hypotensive effect when alprostadil given with diamexide
- Diuretics: enhanced hypotensive effect when alprostadil given with *diuretics*
- Methylpapda: enhanced hypotensive effect when alprostadil given with *methylpapda*
- Moxnixone: enhanced hypotensive effect when alprostadil given with moxonixone
- Nitrites: enhanced hypotensive effect when alprostadil given with nitrites
- Oxytocin: prostaglandins potentiate uteronic effect of *oxytocin*
- Vasodilator Antihypertensives: enhanced hypotensive effect when alprostadil given with *hydralazine*, *minoxidil* or *sodium nitroprusside*
Protein Kinase Inhibitors see Darotinib, Erlotinib,
Everolimus, Gefitinib, Imitinib, Lapatinib, Nilotinib,
Pazopanib, Sorafenib, Sunitinib, and Temsirolimus

Proton Pump Inhibitors
Antacids: absorption of lansoprazole possibly reduced by antacids
Antibacterials: plasma concentration of both drugs increased when omeprazole given with clarithromycin

● Anticoagulants: esomeprazole, omeprazole and pantoprazole possibly enhance anticoagulant effect of coumarins

Antidepressants: omeprazole increases plasma concentration of escitalopram; plasma concentration of lansoprazole possibly increased by fluvoxamine; plasma concentration of omeprazole possibly reduced by St John’s wort

Antiepileptics: esomeprazole enhances effects of phenytoin; omeprazole possibly enhances effects of phenytoin

Antifungals: proton pump inhibitors reduce absorption of triacanazole and ketoconazole; avoidance of proton pump inhibitors advised by manufacturer of posaconazole (plasma concentration of posaconazole possibly reduced); plasma concentration of esomeprazole possibly increased by voriconazole; plasma concentration of omeprazole increased by voriconazole (consider reducing dose of omeprazole)

Antipsychotics: omeprazole possibly reduces plasma concentration of clozapine

Antivirals: proton pump inhibitors reduce plasma concentration of atazanavir—avoid or adjust dose of both drugs (consult product literature); omeprazole reduces plasma concentration of saquinavir—avoid concomitant use; proton pump inhibitors possibly increase plasma concentration of raltegravir—manufacturer of raltegravir advises avoid concomitant use; omeprazole increases plasma concentration of raltegravir—avoid concomitant use; esomeprazole, lansoprazole, pantoprazole and rabeprazole possibly increase plasma concentration of esapinavir—manufacturer of saquinavir advises avoid concomitant use; omeprazole increases plasma concentration of esapinavir—manufacturer of saquinavir advises avoid concomitant use; plasma concentration of esomeprazole and omeprazole reduced by esapinavir

Anxiolytics and Hypnotics: esomeprazole and omeprazole possibly inhibit metabolism of zolpidem (increased plasma concentration)

Cardiac Glycosides: proton pump inhibitors possibly slightly increase plasma concentration of digoxin

Ciclosporin: omeprazole possibly affects plasma concentration of ciclosporin

Clomazol: omeprazole increases plasma concentration of clomazol (consider reducing dose of clomazol)

Clopidogrel: esomeprazole and omeprazole reduce antiplatelet effect of clopidogrel; lansoprazole, pantoprazole and rabeprazole possibly reduce antiplatelet effect of clopidogrel

Cytotoxics: omeprazole possibly reduces excretion of methotrexate (increased risk of toxicity); avoidance of esomeprazole, lansoprazole, pantoprazole and rabeprazole advised by manufacturer of erlotinib; omeprazole reduces plasma concentration of erlotinib—manufacturer of erlotinib advises avoid concomitant use; proton pump inhibitors possibly reduce absorption of lapatinib

Tacrolimus: omeprazole possibly increases plasma concentration of tacrolimus

Ulcer Healing Drugs: absorption of lansoprazole possibly reduced by sucralfate

Ulipristal: avoidance of proton pump inhibitors advised by manufacturer of ulipristal (plasma concentration of ulipristal possibly reduced)

Pseudoephedrine see Sympathomimetics

Appendix 1: Interactions

Pyrazinamide
Probenecid: pyrazinamide antagonises effects of probenecid
Sulfipyrazine: pyrazinamide antagonises effects of sulfipyrazine

Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 767

Pyridostigmine see Parasympathomimetics

Pyridoxine see Vitamins

Pyrimethamine
● Antibacterials: increased antifolate effect when pyrimethamine given with sulfonamides or trimethoprim

● Antiepileptics: pyrimethamine antagonises anti-convulsant effect of phenytoin, also increased antifolate effect

● Antimalarials: avoidance of antimalarials advised by manufacturer of atemether/lumefantrine, increased antifolate effect when pyrimethamine given with propguanil

Antivirals: increased antifolate effect when pyrimethamine given with didovudine

Cytotoxics: pyrimethamine antagonises antifolate effect of mitotrexate and pemetrexed

Histamine: avoidance of antimalarials advised by manufacturer of histamine

Vaccines: antimalarials inactivate oral typhoid vaccine—see p. 767

Quetiapine see Antipsychotics

Quinagolide
Memantine: effects of dopaminergics possibly enhanced by memantine

Methylpiperidine: antiparkinsonian effect of dopaminergics antagonised by methylpiperidine

Quinapril see ACE Inhibitors

Quinine
● Anti-arrhythmics: increased risk of ventricular arrhythmias when quinine given with amiodarone—avoid concomitant use; quinine increases plasma concentration of efecainide

● Antibacterials: increased risk of ventricular arrhythmias when quinine given with moxifloxacin—avoid concomitant use; plasma concentration of quinine reduced by ritampicin

Anticoagulants: plasma concentration of both drugs increased when quinine given with warfarin

Antimalarials: avoidance of antimalarials advised by manufacturer of atemether/lumefantrine; increased risk of ventricular arrhythmias when quinine given with atemether/lumefantrine; increased risk of convulsions when quinine given with metloquine (but should not prevent the use of intravenous quinine in severe cases)

Antipsychotics: increased risk of ventricular arrhythmias when quinine given with risperidone or pimozide—avoid concomitant use; possible increased risk of ventricular arrhythmias when quinine given with haloperidol—avoid concomitant use

Antivirals: plasma concentration of quinine possibly increased by atazanavir, darunavir, fosamprenavir, indinavir, nelfinavir and tipranavir (increased risk of toxicity); plasma concentration of quinine increased by ritonavir (increased risk of toxicity); increased risk of ventricular arrhythmias when quinine given with saquinavir—avoid concomitant use

Cardiac Glycosides: quinine increases plasma concentration of digoxin

Dopaminergics: quinine possibly increases plasma concentration of amantadine

Histamine: avoidance of antimalarials advised by manufacturer of histamine

Muscle Relaxants: quinine possibly enhances effects of aminophenyl

Ulcer Healing Drugs: metabolism of quinine inhibited by cimetidine (increased plasma concentration)
Appendix 1: Interactions

Quinones (continued)
Vaccines: antimalarials inactivate oral typhoid vaccine—see p. 767

Quinolones
- Antidepressants: ciprofloxacin inhibits metabolism of duloxetine—avoid concomitant use; avoidance of ciprofloxacin advised by manufacturer of agomelatine—increased risk of ventricular arrhythmias when moxifloxacin given with
- Beta-blockers: increased risk of ventricular arrhythmias when moxifloxacin given with
disopyramide—avoid concomitant use
- Antacids: absorption of ciprofloxacin, levofloxacin, norfloxacin and ofloxacin reduced by antacids
- Anti-arrhythmics: increased risk of ventricular arrhythmias when levofloxacin or moxifloxacin given with
discoid cataracts—avoid concomitant use; increased risk of ventricular arrhythmias when moxifloxacin co-administered with
discoid cataracts—avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when moxifloxacin given with
discoid cataracts—avoid concomitant use; effects of nalidixic acid possibly antagonised by produces nausea and vomiting—avoid concomitant use
- Anticoagulants: ciprofloxacin, nalidixic acid, norfloxacin and ofloxacin enhance anticoagulant effect of coumarins; levofloxacin possibly enhances anticoagulant effect of coumarins and phenindione
- Antiarrhythmics: ciprofloxacin inhibits metabolism of duloxetine—avoid concomitant use; avoidance of ciprofloxacin advised by manufacturer of agomelatine—increased risk of ventricular arrhythmias when moxifloxacin given with
discoid cataracts—avoid concomitant use
- Antidepressants: ciprofloxacin inhibits metabolism of duloxetine—avoid concomitant use; avoidance of ciprofloxacin advised by manufacturer of agomelatine—increased risk of ventricular arrhythmias when moxifloxacin given with
discoid cataracts—avoid concomitant use
- Antiarrhythmics: increased risk of ventricular arrhythmias when moxifloxacin given with
discoid cataracts—avoid concomitant use
- Calcium Salts: absorption of ciprofloxacin reduced by
calcium salts
- Clopidogrel: increased risk of nephrotoxicity when quinolones given with
clopidogrel
- Clopidogrel: ciprofloxacin possibly reduces antiplatelet effect of
clopidogrel
- Cytoxotics: nalidixic acid increases risk of mesothelioma toxicity; ciprofloxacin possibly reduces excision of methotrexate (increased risk of toxicity); ciprofloxacin increases plasma concentration of etroltinib; increased risk of ventricular arrhythmias when levofloxacin or moxifloxacin given with
- Daily Products: absorption of ciprofloxacin and norfloxacin reduced by daily products
- Dopamine receptors: ciprofloxacin increases plasma concentration of rasagline; ciprofloxacin inhibits

Quinolones
Dopaminergics (continued)
- Dopaminergics: increased plasma concentration of ropinirole (increased plasma concentration)

S-HT: Agonists: quinolones possibly inhibit metabolism of zolmitriptan (reduce dose of zolmitriptan)
- Iron: absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin reduced by iron
- Lanthanum: absorption of quinolones possibly reduced by lanthanum (give at least 2 hours before or 4 hours after lanthanum)
- Muscle Relaxants: norfloxacin possibly increases plasma concentration of tizanidine (increased risk of toxicity); ciprofloxacin increases plasma concentration of tizanidine (increased risk of toxicity)—avoid concomitant use
- Mycophenolate: norfloxacin possibly reduces bioavailability of mycophenolate
- Pentamidine: increased risk of ventricular arrhythmias when moxifloxacin given with
- Pentamidine isethionate: increased risk of ventricular arrhythmias when moxifloxacin given with
- Probenecid: excretion of ciprofloxacin, nalidixic acid and norfloxacin reduced by probenecid (increased plasma concentration)
- Sevelamer: bioavailability of ciprofloxacin reduced by
- Strontium Ranelate: absorption of quinolones reduced by
- Raltegravir: increased plasma concentration of rifampicin (increased plasma concentration)

Raltegravir
- Raltegravir: increased plasma concentration of rifampicin (increased plasma concentration)
- Uler-Healing Drugs: absorption of ciprofloxacin, levofloxacin, norfloxacin and ofloxacin reduced by
cracetate
Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 767
- Zinc: absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin reduced by zinc
- Rabeprazole see Proton Pump Inhibitors

Ranolazine
- Ranolazine: increased risk of ventricular arrhythmias when moxifloxacin given with
- Ranolazine: increased risk of ventricular arrhythmias when moxifloxacin given with
- Ranolazine: increased risk of ventricular arrhythmias when moxifloxacin given with
- Ranolazine: increased risk of ventricular arrhythmias when moxifloxacin given with
- Ranolazine: increased risk of ventricular arrhythmias when moxifloxacin given with
- Ranolazine: increased risk of ventricular arrhythmias when moxifloxacin given with
Antivirals: plasma concentration of ranolazine increased by paroxetine

- Antifungals: plasma concentration of ranolazine increased by ketoconazole, posaconazole and voriconazole—manufacturer of ranolazine advises avoid concomitant use.

- Antivirals: plasma concentration of ranolazine possibly increased by adefovir, darunavir, fosamprenavir, indinavir, nelfinavir, ritonavir, saquinavir and tipranavir—manufacturer of ranolazine advises avoid concomitant use.

- Beta-blockers: manufacturer of ranolazine advises avoid concomitant use with esmolol. Calcium-channel Blockers: plasma concentration of ranolazine increased by diltiazem and verapamil (consider reducing dose of ranolazine).

Cardiac Glycosides: ranolazine increases plasma concentration of digoxin.

Ciclosporin: plasma concentration of ranolazine possibly increased by ciclosporin.

- Grapefruit juice: plasma concentration of ranolazine possibly increased by grapefruit juice—manufacturer of ranolazine advises avoid concomitant use.

- Lipid-regulating Drugs: ranolazine increases plasma concentration of simvastatin (consider reducing dose of simvastatin).

Rasagiline

Note: Rasagiline is a MAO-B inhibitor.

- Analgesics: avoid concomitant use of rasagiline with tramadol.

- Antibacterials: plasma concentration of rasagiline increased by ciprofloxacin.

- Antidepressants: after stopping rasagiline do not start fluoxetine for 2 weeks, also rasagiline should not be started until at least 5 weeks after stopping fluoxetine.

- Fluvoxamine for 2 weeks: risk of hypertensive crisis when rasagiline given with MAOIs, avoid MAOIs for at least 2 weeks after stopping rasagiline; increased risk of CNS toxicity when rasagiline given with SSRIIs or tricyclics.

- Dopamineergics: plasma concentration of rasagiline possibly reduced by entacapone.

- Memantine: effects of dopamineergics possibly enhanced by memantine.

- Methyldopa: antiparkinsonian effect of dopamineergics antagonised by methyldopa.

- Sympathomimetics: avoid concomitant use of rasagiline with sympathomimetics.

Reboxetine

- Antibacterials: manufacturer of reboxetine advises avoid concomitant use with macrolides.

- Antidepressants: manufacturer of reboxetine advises avoid concomitant use with fluoxetine, flufenoxamine: increased risk of hypertension and CNS excitation when reboxetine given with MAOIs (MAOIs should not be started until 1 week after stopping reboxetine, avoid reboxetine for 2 weeks after stopping MAOIs).

- Antifungals: manufacturer of reboxetine advises avoid concomitant use with azoles and eritrotoxines.

- Antimalarials: avoidance of antidepressants advised by manufacturer of aemetether/lumefantrine.

- Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine.

- Diuretics: possible increased risk of hypokalaemia when reboxetine given with loop diuretics or thiazides and related diuretics.

- Ergot Alkaloids: possible risk of hypertension when reboxetine given with ergotamine and methysergide.

Remifentanil see Opioid Analgesics

Rifampicin see Rifamycins

Rifamycins

ACE Inhibitors: rifampicin reduces plasma concentration of active metabolite of imidapril (reduced antihypertensive effect)

- Analgesics: rifampicin reduces plasma concentration of celecoxib, diclofenac and etoricoxib; rifampicin accelerates metabolism of alfentanil, codeine, fentanyl, methadone and morphine (reduced effect); rifampicin possibly accelerates metabolism of oxycodeone.

- Angiotensin-II Receptor Antagonists: rifampicin reduces plasma concentration of losartan and its active metabolite.

- Antacids: absorption of rifampicin reduced by antacids.

- Anti-arrhythmics: rifamycins accelerate metabolism of disopyramide (reduced plasma concentration); rifampicin reduces plasma concentration of dronedarone—avoid concomitant use; rifampicin accelerates metabolism of propafenone (reduced effect).

- Antibacterials: rifamycins reduce plasma concentration of clarithromycin and dapsone; plasma concentration of rifabutin increased by clarithromycin (increased risk of uveitis—reduce rifabutin dose); rifampicin reduces plasma concentration of doxycycline—consider increasing dose of doxycycline; rifampicin accelerates metabolism of chloramphenicol (reduced plasma concentration); rifampicin reduces plasma concentration of linezolid (possible therapeutic failure of linezolid); plasma concentration of rifabutin possibly increased by macrolides (increased risk of uveitis—reduce rifabutin dose); rifampicin reduces plasma concentration of telithromycin (avoid during and for 2 weeks after rifampicin); rifampicin possibly plasma concentration of trimethoprim.

- Anticoagulants: rifamycins accelerate metabolism of coumarins (reduced anticoagulant effect); rifampicin reduces plasma concentration of rivaroxaban.

- Antidiabetics: rifamycins accelerate metabolism of tolbutamide (reduced effect); rifampicin reduces plasma concentration of nateglinide; rifampicin possibly antagonises hypoglycaemic effect of repaglinide; rifamycins possibly accelerate metabolism of nilotinib (reduced effect).
Appendix 1: Interactions

### Rifamycins (continued)

- **Antiepileptics:** rifabutin reduces plasma concentration of carbamazepine; rifampicin reduces plasma concentration of lamotrigine; rifamycins accelerate metabolism of ethosuximide (reduced plasma concentration).

- **Antifungals:** rifampicin accelerates metabolism of ketoconazole and itraconazole (reduced plasma concentration); rifabutin reduces plasma concentration of itraconazole—avoid concomitant use; plasma concentration of rifabutin increased by posaconazole (also plasma concentration of posaconazole reduced); rifampicin reduces plasma concentration of posaconazole and eritromicina; plasma concentration of rifabutin increased by voriconazole, also rifabutin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for rifabutin toxicity); rifampicin reduces plasma concentration of voriconazole—avoid concomitant use; rifampicin initially increases and then reduces plasma concentration of caspofungin (consider increasing dose of caspofungin); plasma concentration of rifabutin possibly increased by triazoles (increased risk of uveitis—reduce rifabutin dose).

- **Antihistamines:** rifampicin possibly reduces effects of fexofenadine.

- **Antimalarials:** rifampicin reduces plasma concentration of mefloquine—avoid concomitant use; rifampicin reduces plasma concentration of equinone.

- **Antimicrobials:** rifampicin reduces plasma concentrations of active metabolite of fosfomycin.

- **Antipsychotics:** rifampicin accelerates metabolism of haloperidol (reduced plasma concentration); rifabutin and rifampicin possibly reduce plasma concentration of aripiprazole—increase dose of aripiprazole; rifampicin possibly reduces plasma concentration of clozapine.

- **Antivirals:** rifampicin possibly reduces plasma concentration of aciclovir and ritonavir; rifampicin reduces plasma concentration of atazanavir, lopinavir and saquinavir—avoid concomitant use; plasma concentration of rifampicin increased by atazanavir, darunavir, fosamprenavir and tipranavir (reduce dose of rifabutin); rifampicin significantly reduces plasma concentration of darunavir, fosamprenavir and nelfinavir—avoid concomitant use; plasma concentration of rifabutin reduced by efavirenz—increase dose of rifabutin; rifampicin reduces plasma concentration of efavirenz—increase dose of efavirenz; plasma concentration of both drugs reduced when rifabutin given with etravirine; avoidance of rifampicin advised by manufacturer of etravirine and zidovudine; rifampicin accelerates metabolism of indinavir (reduced plasma concentration—avoid concomitant use); plasma concentration of rifabutin increased by indinavir—avoid concomitant use; rifampicin reduces plasma concentration of maraviroc and raltegravir—consider increasing dose of maraviroc and raltegravir; plasma concentration of rifabutin increased by nelfinavir (halve dose of rifabutin); plasma concentration of rifabutin possibly increased by nevirapine; plasma concentration of rifabutin increased by ritonavir (increased risk of toxicity); rifampicin significantly reduces plasma concentration of saquinavir, also risk of hepatotoxicity—avoid concomitant use; plasma concentration ofrifabutin increased by saquinavir (also plasma concentration of saquinavir reduced); rifampicin possibly reduces plasma concentration of tipranavir—avoid concomitant use.

### Rifamycins (continued)

- **Anxiolytics and Hypnotics:** rifampicin accelerates metabolism of diazepam (reduced plasma concentration); rifampicin possibly accelerates metabolism of benzodiazepines (reduced plasma concentration); rifampicin possibly accelerates metabolism of buspirone and zaleplon; rifampicin accelerates metabolism of zolpidem (reduced plasma concentration and reduced effect); rifampicin significantly reduces plasma concentration of zopiclone.

- **Antituberculosis:** rifampicin reduces plasma concentration of aprepitant.

- **Barbiturates:** plasma concentration of rifampicin possibly reduced by phenobarbital.

- **Beta-blockers:** rifampicin accelerates metabolism of bisoprolol and propranolol (plasma concentration significantly reduced); rifampicin reduces plasma concentration of carvedilol, celiprolol and metoprolol.

- **Beta-blockers:** bosentan: rifampicin reduces plasma concentration of bosentan—avoid concomitant use.

- **Calcium-channel Blockers:** rifampicin possibly accelerates metabolism of isradipine and nifedipine (possibly significantly reduced plasma concentration); rifampicin accelerates metabolism of etilsazem, nifedipine, nimohipidone and everapamol (plasma concentration significantly reduced).

- **Cardiac Glycosides:** rifampicin possibly reduces plasma concentration of digoxin.

- **Ciclosporin:** rifampicin accelerates metabolism of ciclosporin (reduced plasma concentration).

- **Corticosteroids:** rifampicin accelerates metabolism of dexamethasone (reduced plasma concentration; avoid concomitant use); rifampicin accelerates metabolism of erlotinib and sunitinib (reduced plasma concentration); rifampicin reduces plasma concentration of everolimus and sorafenib; rifampicin reduces plasma concentration of gefitinib, imatinib and milotinib—avoid concomitant use; avoidance of ritabutin and rifampicin advised by manufacturer of lapatinib; avoidance of rifampicin advised by manufacturer of pazopanib; rifampicin reduces plasma concentration of active metabolite of temsirolimus—avoid concomitant use; rifampicin possibly reduces plasma concentration of vinflunine—manufacturer of vinflunine advises avoid concomitant use.

- **Deferasirox:** rifampicin reduces plasma concentration of deferasirox.

- **Diuretics:** rifampicin reduces plasma concentration of eplerenone—avoid concomitant use.

- **Hormone Antagonists:** rifampicin possibly reduces plasma concentration of exemestane; rifampicin accelerates metabolism of tamoxifen (reduced plasma concentration).

- **HIV, Antagonists:** rifampicin accelerates metabolism of ondasertron (reduced effect).

- **Lefunomide:** rifampicin possibly increases plasma concentration of active metabolite of lefunomide.

- **Lipid-regulating Drugs:** rifampicin possibly reduces plasma concentration of atorvastatin and simvastatin; rifampicin accelerates metabolism of fluvastatin (reduced effect).

- **Mycophenolate:** rifampicin reduces plasma concentration of active metabolite of mycophenolate.

- **Oestrogens:** rifampicin accelerates metabolism of oestrogens (reduced contraceptive effect—see p. 495).

- **Progestogens:** rifampicin accelerates metabolism of progestogens (reduced contraceptive effect—see p. 495).
BNF 61

Appendix 1: Interactions 875

Rifamycins (continued)
- Tadalafil: rifampicin reduces plasma concentration of tadalafil—manufacturer of tadalafil advises avoid concomitant use.
- Rosuvastatin: rifampicin reduces plasma concentration of rosvastatin—consider increasing dose of rosvu-
- Sirolimus: rifabutin and rifampicin reduce plasma concentration of sirolimus—avoid concomitant use.
- Tacrolimus: rifabutin possibly reduces plasma concentration of tacrolimus; rifampicin reduces plasma concentration of tacrolimus.
- Tadalafil: rifampicin reduces plasma concentration of tadalafil—manufacturer of tadalafil advises avoid concomitant use.

Ritonavir
- Antidepressants (continued): plasma concentration of trazodone (increased risk of toxicity); ritonavir possibly increases plasma concentration of SSRIAs and SNRIs—avoid concomitant use.
- Antidiabetics: ritonavir possibly increases plasma concentration of tolbutamide.
- Antiepileptics: ritonavir possibly increases plasma concentration of carbamazepine; ritonavir possibly reduces plasma concentration of lamotrigine; plasma concentration of ritonavir possibly reduced by phenytoin, also plasma concentration of phenytoin possibly affected.
- Antifungals: combination of ritonavir with itraconazole or ketoconazole may increase plasma concentration of either drug (or both); plasma concentration of ritonavir increased by fluconazole; ritonavir reduces plasma concentration of voriconazole—avoid concomitant use.
- Antimalarials: caution with ritonavir advised by manufacturer of arteether/lumefantrine; ritonavir increases plasma concentration of equinone (increased risk of toxicity).
- Antimuscarnics: avoidance of ritonavir advised by manufacturer of darifenacin and tolterodine; manu-
- Antipsychotics: ritonavir possibly increases plasma concentration of antipsychotics; ritonavir possibly inhibits metabolism of aripiprazole (reduce dose of aripiprazole); ritonavir increases plasma concentration of olanzapine (increased risk of toxicity)—avoid concomitant use; ritonavir reduces plasma concentration of olanzapine—consider increasing dose of olanzapine; ritonavir increases plasma concentration of pimozide (increased risk of ventricular arrhyth-
- Antivirals: ritonavir increases toxicity of efavirenz, monitor liver function tests; ritonavir increases plasma concentration of indinavir, maraviroc and saquinavir; combination of ritonavir with nevirapine may increase plasma concentration of either drug (or both).
- Anxiolytics and Hypnotics: ritonavir possibly increases plasma concentration of anxiolytics and hypnotics; ritonavir possibly increases plasma concentration of alprazolam, diazepam, flurazepam and zolpidem (risk of extreme sedation and respiratory depression—avoid concomitant use); ritonavir possibly increases plasma concentration of midazolam (risk of prolonged sedation—avoid concomitant use of oral midazolam); ritonavir increases plasma concentration of buspirone (increased risk of toxicity).
- Antihypertensives: ritonavir possibly increases plasma concentration of aprepiant.
- Bacteriostatic: ritonavir possibly increases plasma concentration of fosfomycin.
- Bupropion: ritonavir reduces plasma concentration of bupropion.
- Calcium-channel Blockers: ritonavir possibly increases plasma concentration of calcium-channel blockers; avoidance of ritonavir advised by manu-
- Cardiac Glycosides: ritonavir possibly increases plasma concentration of digoxin.
- Colchicine: ritonavir possibly increases risk of colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment).
Ritonavir (continued)

- Corticosteroids: ritonavir possibly increases plasma concentration of corticosteroids, dexamethasone and prednisolone; ritonavir increases plasma concentration of inhaled and intranasal budesonide and fluicasone.
- Cytoxicants: ritonavir possibly increases plasma concentration of etorofurilum and enalaprilat—manufacturer of enalaprilat and vasopressin advises avoid concomitant use; avoidance of ritonavir advised by manufacturer of lopatatinib, sitotatinib and pazopanib; ritonavir possibly plasma concentration of diuretics (increased risk of toxicity); ritonavir increases plasma concentration of paclitaxel; ritonavir possibly increases plasma concentration of vinblamine.
- Diuretics: ritonavir increases plasma concentration of spironolactone—avoid concomitant use.
- Ergot Alkaloids: increased risk of ergotism when ritonavir with ergotamine and methylergometrine—avoid concomitant use.
- SHT, Agonists: ritonavir increases plasma concentration of eletriptan (risk of toxicity)—avoid concomitant use.
- Ibraprodine: ritonavir possibly increases plasma concentration of vardenafil—avoid concomitant use.
- Lipid-regulating Drugs: possible increased risk of myopathy when ritonavir with atorvastatin; possible increased risk of myopathy when ritonavir with rosuvastatin—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when ritonavir with simvastatin (avoid concomitant use).
- Oestrogens: ritonavir accelerates metabolism of oestrogens (reduced contraceptive effect—see p. 495).
- Ranolazine: ritonavir possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use.
- Sildenafil: ritonavir significantly increases plasma concentration of sildenafil—avoid concomitant use.
- Tacrolimus: ritonavir possibly increases plasma concentration of tacrolimus.
- Tadalafil: ritonavir increases plasma concentration of tadalafil—manufacturer of tadalafil advises avoid concomitant use.
- Theophylline: ritonavir accelerates metabolism of theophylline (reduced plasma concentration).
- Ulipristal: avoidance of ritonavir advised by manufacturer of ulipristal (contraceptive effect of ulipristal possibly reduced).
- Vardenafil: ritonavir increases plasma concentration of vardenafil—avoid concomitant use.

Rivaroxaban

- Analgesics: increased risk of haemorrhage when anticoagulants given with intravenous diclofenac (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with ketorolac (avoid concomitant use, including low-dose heparins).
- Antibacterials: plasma concentration of rivaroxaban reduced by rifampicin.
- Antifungals: plasma concentration of rivaroxaban increased by ketoconazole (avoid concomitant use; manufacturer of rivaroxaban advises avoid concomitant use with iraconazole, posaconazole and voriconazole).
- Antivirals: manufacturer of ravigoxaban advises avoid concomitant use with atazanavir, darunavir and fosamprenavir, indinavir, lopinavir, nelfinavir, saquinavir and tipranavir; plasma concentration of ravigoxaban increased by ritonavir—manufacturer of ravigoxaban advises avoid concomitant use.

Rivastigmine see Parasympathomimetics

Rizatriptan see SHT, Agonists

Rocuronium see Muscle Relaxants

Roflumilast

- Antibacterials: plasma concentration of roflumilast reduced by rifampicin—consider increasing dose of roflumilast.
- Antidepressants: metabolism of roflumilast inhibited by fluvoxamine.
- Theophylline: manufacturer of roflumilast advises avoid concomitant use with theophylline.
- Ulcer-healing Drugs: metabolism of roflumilast inhibited by cimetidine.

Ropinorole

- Antibacterials: metabolism of ropinorrole inhibited by ciprofloxacin (increased plasma concentration).
- Antipsychotics: manufacturer of ropinorrole advises avoid concomitant use of antipsychotics (antagonism of effect).
- Memantine: effects of dopaminergics possibly enhanced by memantine.
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa.
- Metoclopramide: manufacturer of ropinorrole advises avoid concomitant use of metoclopramide (antagonism of effect).
- Oestrogens: plasma concentration of ropinorrole increased by oestrogens.

Ropivacaine

- Anti-arrhythmics: increased myocardial depression when ropivacaine given with anti-arrhythmics.
- Antipsychotics: metabolism of ropivacaine inhibited by fluvoxamine—avoid prolonged administration of ropivacaine.

Rosuvastatin see Statins

Rotigotine

- Antipsychotics: manufacturer of rotigotine advises avoid concomitant use of antipsychotics (antagonism of effect).
- Memantine: effects of dopaminergics possibly enhanced by memantine.
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa.
- Metoclopramide: manufacturer of rotigotine advises avoid concomitant use of metoclopramide (antagonism of effect).

Rufinamide

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with St. John’s wort.
- Antiepileptics: plasma concentration of both drugs possibly reduced when rufinamide given with carbamazepine; plasma concentration of rufinamide possibly reduced by phenytoin, also plasma concentration of phenytoin possibly increased; plasma concentration of rufinamide possibly reduced by primidone; plasma concentration of rufinamide possibly increased by valproate (reduce dose of rufinamide).
- Antiarrhythmics: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by mefloquine.

Barbiturates: plasma concentration of rufinamide possibly reduced by phenobarbital, also plasma concentration of phenobarbital possibly increased.
- Oestrogens: rufinamide accelerates metabolism of oestrogens (reduced contraceptive effect—see p. 495).
- Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat.
- Progestogens: rufinamide accelerates metabolism of progestogens (reduced contraceptive effect—see p. 495).

Rupatadine see Antihistamines.
BNF 61

Appendix 1: Interactions 877

St John's Wort
Analgesics: St John's wort possibly reduces plasma concentration of methadone

Anti-arrhythmics: St John's wort possibly reduces plasma concentration of "erodenedaron"—avoid concomitant use

Antibacterials: St John's wort reduces plasma concentration of "elithromycin" (avoid during and for 2 weeks after St John's wort)

Anticoagulants: St John's wort reduces anticoagulant effect of coumarins (avoid concomitant use)

Antidepressants: possible increased serotonergic effects when St John's wort given with "duloxetine" or venlafaxine; St John's wort reduces plasma concentration of amitriptyline; increased serotonergic effects when St John's wort given with "SSRIs"—avoid concomitant use

Antiepileptics: avoid concomitant use of St John's wort with antiepileptics

Antifungals: St John's wort possibly reduces plasma concentration of "aripiprazole"—increase dose of aripiprazole

Antivirals: St John's wort reduces plasma concentration of "azazanavir", "darunavir", "efavirenz", "fosamprenavir", "indinavir", "lopinavir", "nelfinavir", "nevirapine", "ritonavir" and "saquinavir"—avoid concomitant use; St John's wort possibly reduces plasma concentration of "maraviroc" and "etripivar"—avoid concomitant use

Antivirals: plasma concentration of saquinavir increased when saquinavir given with "atovaquone"; increased risk of ventricular arrhythmias when saquinavir given with "claritythromycin","dapsone" or "erythromycin"—avoid concomitant use; saquinavir increases plasma concentration of "rifabutin" (also plasma concentration of saquinavir reduced); plasma concentration of saquinavir significantly reduced by "rifampicin", also risk of hepatotoxicity—avoid concomitant use, avoidance of concomitant saquinavir in severe renal and hepatic impairment advised by manufacturer of "elithromycin"

Anticoagulants: saquinavir possibly enhances anti-coagulant effect of warfarin; avoidance of saquinavir advised by manufacturer of rivaroxaban

Antidepressants: increased risk of ventricular arrhythmias when saquinavir given with "clarithromycin", "dapsone" or "erythromycin"—avoid concomitant use; plasma concentration of saquinavir reduced by St John's wort—avoid concomitant use

Antiepileptics: plasma concentration of saquinavir possibly reduced when carbamazepine, phenytoin and primidone

Antifungals: plasma concentration of saquinavir increased by "ketocanazole"; plasma concentration of saquinavir possibly increased by "imidazoles" and "triazoles"

Antihistamines: increased risk of ventricular arrhythmias when saquinavir given with "mizolactam"—avoid concomitant use

Antimalarial: caution with saquinavir advised by manufacturer of "artemether/lumefantrine"; increased risk of ventricular arrhythmias when saquinavir given with "quinine"—avoid concomitant use

Antimuscarinics: avoidance of saquinavir advised by manufacturer of "dabrafenin" and "tolterodine"; manufacturer of "darifenacin" and "tolterodine"; manufacturer of saquinavir advises avoid concomitant use; saquinavir increases plasma concentration of "pimozide" (increased risk of ventricular arrhythmias—avoid concomitant use)

Antivirals: increased risk of ventricular arrhythmias when saquinavir given with "lozacrine", "lapidinavir", "haloperidol" or "phenothiazines"—avoid concomitant use; saquinavir possibly inhibits metabolism of "aripiprazole"; saquinavir possibly increases plasma concentration of "pimozide" (increased risk of ventricular arrhythmias—avoid concomitant use)

Antivirals: increased risk of ventricular arrhythmias when saquinavir given with "atovaquone"; saquinavir reduces plasma concentration of "darunavir"; plasma concentration of saquinavir significantly reduced by "efavirenz"; plasma concentration of saquinavir increased by "indinavir" and "ritonavir"; saquinavir increases plasma concentration of "maraviroc" (consider reducing dose of maraviroc); plasma concentration of saquinavir increased by "nelfinavir" or manufacturer of saquinavir advises avoid concomitant use; plasma concentration of saquinavir reduced by "etripivar"

Antialcoholics and Hypnotics: saquinavir increases plasma concentration of "midazolam" (risk of pro-
Appendix 1: Interactions

**Sildenafil**
- **Antidepressants**: 
  - **continued**
  - with paroxetine (sildenafil should not be started until 2 weeks after stopping paroxetine, avoid paroxetine for 2 weeks after stopping sildenafil); enhanced hypotensive effect when sildenafil given with MAOIs—manufacturer of selegiline advises avoid concomitant use; avoid concomitant use of selegiline with moclobemide; CNS toxicity reported when sildenafil given with citalopram and escitalopram
  - Dopaminergics: max. dose of 10 mg selegiline advised by manufacturer of entacapone if used concomitantly; selegiline enhances effects and increases toxicity of levodopa (additive increase of levodopa) 5HT, Agonists: manufacturer of selegiline advises avoid concomitant use with 5HT, agonists
  - Memantine: effects of dopaminergics and selegiline possibly enhanced by memantine
  - Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa
- **Oestrogens**: plasma concentration of selegiline increased by oestrogens—manufacturer of selegiline advises avoid concomitant use
- **Progestogens**: plasma concentration of selegiline increased by progestogens—manufacturer of selegiline advises avoid concomitant use
- **Sympathomimetics**: risk of hypertensive crisis when selegiline given with dopamine

**Selenium**
- Eltrombopag: selenium possibly reduces absorption of eltrombopag (give at least 4 hours apart)
- Vitamins: absorption of selenium possibly reduced by ascorbic acid (give at least 4 hours apart)

**Sertraline** see Antidepressants, SSRI

**Selevanin**
- **Antibacterials**: selevanin reduces bioavailability of ciprofloxacin
  - Ciclosporin: selevanin possibly reduces plasma concentration of ciclosporin
  - Mycophenolate: selevanin possibly reduces plasma concentration of mycophenolate
  - Tacrolimus: selevanin possibly reduces plasma concentration of tacrolimus
- **Thyroid Hormones**: selevanin possibly reduces absorption of levothyroxine

**Sevoflurane** see Anaesthetics, General

**Sildenafil**
- **Alpha-blockers**: enhanced hypotensive effect when sildenafil given with alpha-blockers for 4 hours after sildenafil—see also p. 515
- **Antibacterials**: plasma concentration of sildenafil possibly increased by clarithromycin and telithromycin—reduce initial dose of sildenafil; plasma concentration of sildenafil significantly increased by erythromycin—reduce initial dose of sildenafil
- **Antifungals**: plasma concentration of sildenafil increased by itraconazole and ketoconazole—reduce initial dose of sildenafil
- **Antivirals**: side-effects of sildenafil possibly increased by azithromycin; plasma concentration of sildenafil reduced by etravirine; plasma concentration of sildenafil possibly increased by fosamprenavir; plasma concentration of sildenafil increased by indinavir—reduce initial dose of sildenafil; plasma concentration of sildenafil possibly increased by nelfinavir—reduce initial dose of sildenafil; plasma concentration of sildenafil significantly increased by ritonavir—avoid concomitant use; increased risk of ventricular arrhythmias when sildenafil given with saquinavir—avoid concomitant use

**Bosentan**: plasma concentration of sildenafil reduced by bosentan
- Calcium-channel Blockers: enhanced hypotensive effect when sildenafil given with amlopidine
- Grapefruit Juice: plasma concentration of sildenafil possibly increased by grapefruit juice

---

**Serefrin** see Antidepressants, SSRI

**Selenium**
- Eltrombopag: selenium possibly reduces absorption of eltrombopag (give at least 4 hours apart)
- Vitamins: absorption of selenium possibly reduced by ascorbic acid (give at least 4 hours apart)

**Sildenafil**
- **Antidepressants**: 
  - **continued**
  - with paroxetine (sildenafil should not be started until 2 weeks after stopping paroxetine, avoid paroxetine for 2 weeks after stopping sildenafil); enhanced hypotensive effect when sildenafil given with MAOIs—manufacturer of selegiline advises avoid concomitant use; avoid concomitant use of selegiline with moclobemide; CNS toxicity reported when sildenafil given with citalopram and escitalopram
  - Dopaminergics: max. dose of 10 mg selegiline advised by manufacturer of entacapone if used concomitantly; selegiline enhances effects and increases toxicity of levodopa (additive increase of levodopa) 5HT, Agonists: manufacturer of selegiline advises avoid concomitant use with 5HT, agonists
  - Memantine: effects of dopaminergics and selegiline possibly enhanced by memantine
  - Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa
- **Oestrogens**: plasma concentration of selegiline increased by oestrogens—manufacturer of selegiline advises avoid concomitant use
- **Progestogens**: plasma concentration of selegiline increased by progestogens—manufacturer of selegiline advises avoid concomitant use
- **Sympathomimetics**: risk of hypertensive crisis when selegiline given with dopamine

**Selenium**
- Eltrombopag: selenium possibly reduces absorption of eltrombopag (give at least 4 hours apart)
- Vitamins: absorption of selenium possibly reduced by ascorbic acid (give at least 4 hours apart)

**Sertraline** see Antidepressants, SSRI

**Selevanin**
- **Antibacterials**: selevanin reduces bioavailability of ciprofloxacin
  - Ciclosporin: selevanin possibly reduces plasma concentration of ciclosporin
  - Mycophenolate: selevanin possibly reduces plasma concentration of mycophenolate
  - Tacrolimus: selevanin possibly reduces plasma concentration of tacrolimus
- **Thyroid Hormones**: selevanin possibly reduces absorption of levothyroxine

**Sevoflurane** see Anaesthetics, General

**Sildenafil**
- **Alpha-blockers**: enhanced hypotensive effect when sildenafil given with alpha-blockers for 4 hours after sildenafil—see also p. 515
- **Antibacterials**: plasma concentration of sildenafil possibly increased by clarithromycin and telithromycin—reduce initial dose of sildenafil; plasma concentration of sildenafil significantly increased by erythromycin—reduce initial dose of sildenafil
- **Antifungals**: plasma concentration of sildenafil increased by itraconazole and ketoconazole—reduce initial dose of sildenafil
- **Antivirals**: side-effects of sildenafil possibly increased by azithromycin; plasma concentration of sildenafil reduced by etravirine; plasma concentration of sildenafil possibly increased by fosamprenavir; plasma concentration of sildenafil increased by indinavir—reduce initial dose of sildenafil; plasma concentration of sildenafil possibly increased by nelfinavir—reduce initial dose of sildenafil; plasma concentration of sildenafil significantly increased by ritonavir—avoid concomitant use; increased risk of ventricular arrhythmias when sildenafil given with saquinavir—avoid concomitant use

**Bosentan**: plasma concentration of sildenafil reduced by bosentan
- Calcium-channel Blockers: enhanced hypotensive effect when sildenafil given with amlopidine
- Grapefruit Juice: plasma concentration of sildenafil possibly increased by grapefruit juice

---

**Serefrin** see Antidepressants, SSRI

**Selenium**
- Eltrombopag: selenium possibly reduces absorption of eltrombopag (give at least 4 hours apart)
- Vitamins: absorption of selenium possibly reduced by ascorbic acid (give at least 4 hours apart)
Sildenafil (continued)
- Nicardipine: sildenafil significantly enhances hypotensive effect of nicardipine (avoid concomitant use)
- Nitrates: sildenafil significantly enhances hypotensive effect of nitrates (avoid concomitant use)

Ulcer-healing Drugs: plasma concentration of sildenafil increased by cimetidine (consider reducing dose of sildenafil)

Simvastatin see Statins

Sodium

Anti-arrhythmics: caution with sodium advised by manufacturer of dronedarone

Antibacterials: plasma concentration of sirolimus increased by clarithromycin and telithromycin—avoid concomitant use; plasma concentration of both drugs increased when sirolimus given with erythromycin; plasma concentration of sirolimus reduced by rifabutin and rifampicin—avoid concomitant use

Antifungals: plasma concentration of sirolimus increased by itraconazole, ketoconazole and voriconazole—avoid concomitant use; plasma concentration of sirolimus increased by miconafungin and micafungin; plasma concentration of sirolimus possibly increased by posaconazole

Antivirals: plasma concentration of sirolimus possibly increased by abacavir and dolutegravir

Calcium-channel Blockers: plasma concentration of sirolimus increased by diltiazem; plasma concentration of both drugs increased when sirolimus given with verapamil

Ciclosporin: plasma concentration of sirolimus increased by cyclosporin

Grapefruit Juice: plasma concentration of sirolimus increased by grapefruit juice—avoid concomitant use

Sitagliptin see Antidiabetics

Sitaxentan
- Anticoagulants: sitaxentan enhances anticoagulant effect of warfarin; fluvastatin and atorvastatin increased by telithromycin; atorvastatin and simvastatin possibly reduced by rifampicin
- Anticoagulants: sitaxentan increases plasma concentration of pravastatin reduced by atorvastatin and simvastatin possibly reduced by rifampicin
- Anticoagulants: sitaxentan increases plasma concentration of oestrogens possibly increased by rifampicin
- Anticoagulants: sitaxentan increases plasma concentration of progestogens increased by progesterone
- ACE Inhibitors: flushing and hypotension reported when sodium aurothiomalate given with ACE inhibitors
- Penicillamine: avoidance of sodium aurothiomalate advised by manufacturer of penicillamine (increased risk of toxicity)

Sodium Benzoate
- Antiepileptics: effects of sodium benzoate possibly reduced by valproate
- Antipsychotics: effects of sodium benzoate possibly reduced by haloperidol
- Corticosteroids: effects of sodium benzoate possibly reduced by corticosteroids
- Probenecid: excretion of conjugate formed by sodium benzoate possibly reduced by probenecid

Sodium Bicarbonate see Antacids

Sodium Citrate
- Anticoagulants: avoid concomitant use of sodium citrate with methenamine
- Sodium Citraconate see Bisphosphonates

Sodium Nitroprusside see Vasodilators Anti-hypertensives

Sodium Oxalate
- Analgesics: effects of sodium oxalate enhanced by opioid analgesics (avoid concomitant use)
- Antidepressants: increased risk of side-effects when sodium oxalate given with tricyclics
- Antipsychotics: effects of sodium oxalate possibly enhanced by antipsychotics

Sodium Oxybate (continued)
- Anxiolytics and Hypnotics: effects of sodium oxybate enhanced by benzodiazepines (avoid concomitant use)
- Barbiturates: effects of sodium oxybate enhanced by barbiturates (avoid concomitant use)

Sodium Phenylbutyrate
- Antiepileptics: effects of sodium phenylbutyrate possibly reduced by valproate
- Antipsychotics: effects of sodium phenylbutyrate possibly reduced by haloperidol
- Corticosteroids: effects of sodium phenylbutyrate possibly reduced by corticosteroids
- Probenecid: excretion of conjugate formed by sodium phenylbutyrate possibly reduced by probenecid

Sodium Valproate see Valproate

Solifenacin see Antimuscarinics

Somatropin
- Corticosteroids: growth-promoting effect of somatropin may be inhibited by corticosteroids
- Oestrogens: increased doses of somatropin may be needed when given with oestrogens (when used as oral replacement therapy)

Sorafenib
- Anticoagulants: sorafenib possibly enhanced anticoagulant effect of coumarins
- Antiepileptics: cytoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytoxics with doxaprine (increased risk of agranulocytosis)
- Cardiac Glycosides: cytoxics reduce absorption of digoxin tablets
- Cytotoxics: sorafenib possibly increases plasma concentration of doxorubicin and irinotecan; sorafenib increases plasma concentration of docetaxel

Sotalol see Beta-blockers

Spiropionolactone see Diuretics

Statins
- Antacids: absorption of rosuvastatin reduced by antacids
- Anti-arrhythmics: increased risk of myopathy when simvastatin given with amiodarone or dronedarone
- Anticoagulants: plasma concentration of atorvastatin and pravastatin increased by clarithromycin; increased risk of myopathy when simvastatin given with clarithromycin, erythromycin or telithromycin (avoid concomitant use); plasma concentration of rosuvastatin reduced by erythromycin; possible increased risk of myopathy when atorvastatin given with erythromycin or fusidic acid; plasma concentration of pravastatin increased by erthyromycin; plasma concentration of atorvastatin and simvastatin possibly reduced by rifampicin; metabolism of fluvastatin accelerated by rifampicin (reduced effect); increased risk of myopathy when statins given with daptomycin (preferably avoid concomitant use); increased risk of myopathy when simvastatin given with fusidic acid; possible increased risk of myopathy when pravastatin given with telithromycin; increased risk of myopathy when atorvastatin given with telithromycin (avoid concomitant use)
- Anticoagulants: atorvastatin may transiently reduce anticoagulant effect of warfarin; fluvastatin and simvastatin enhance anticoagulant effect of coumarins; rosuvastatin possibly enhances anticoagulant effect of coumarins and phenindione
- Antidepressants: plasma concentration of simvastatin reduced by St John’s wort
- Antidiabetics: fluvastatin possibly increases plasma concentration of glibenclamide
- Antiepileptics: plasma concentration of simvastatin reduced by carbamazepine—consider increasing dose of simvastatin; combination of fluvastatin with
Appendix 1: Interactions

Statins
- Antiepileptics (continued) phenoxybenzamine may increase plasma concentration of either drug (or both)
- Antifungals: increased risk of myopathy when simvastatin given with ketoconazole, itraconazole, fluconazole, posaconazole (avoid concomitant use); possible increased risk of myopathy when simvastatin given with niacin (avoid concomitant use); plasma concentration of fluvastatin increased by fluconazole; increased risk of myopathy when atorvastatin given with ketoconazole or posaconazole (avoid concomitant use); possible increased risk of myopathy when atorvastatin given with itraconazole or ketoconazole (avoid concomitant use); possible increased risk of myopathy when atorvastatin or simvastatin given with imidazoles; possible increased risk of myopathy when atorvastatin or simvastatin given with triazoles
- Antivirals; possible increased risk of myopathy when atorvastatin given with atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, ritonavir, saquinavir, and saquinavir—manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when simvastatin given with atazanavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir or saquinavir; plasma concentration of pravastatin possibly increased by darunavir; plasma concentration of atorvastatin, pravastatin and simvastatin reduced by efavirenz; plasma concentration of atorvastatin possibly reduced by etravirine; possible increased risk of myopathy when simvastatin given with atazanavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir or saquinavir; plasma concentration of pravastatin possibly increased by darunavir; plasma concentration of atorvastatin, pravastatin and simvastatin reduced by efavirenz; plasma concentration of atorvastatin possibly reduced by etravirine; possible increased risk of myopathy when simvastatin given with fosamprenavir or lopinavir—avoid concomitant use; plasma concentration of atorvastatin possibly increased by pranavir—avoid concomitant use; plasma concentration of atorvastatin possibly increased by pranavir (consider reducing dose of atorvastatin); plasma concentration of rosuvastatin possibly increased by pranavir—manufacturer of rosuvastatin advises avoid concomitant use
- Bosentan: plasma concentration of simvastatin reduced by bosentan
- Calcium-channel Blockers: possible increased risk of myopathy when simvastatin given with amlodipine; plasma concentration of atorvastatin and simvastatin increased by diltiazem—possible increased risk of myopathy; increased risk of myopathy when simvastatin given with verapamil
- Ciclosporin: increased risk of myopathy when statins given with ciclosporin; increased risk of myopathy when rosuvastatin given with ciclosporin (avoid concomitant use)
- Colchicine: possible increased risk of myopathy when statins given with colchicine
- Cytotoxics: plasma concentration of ciclosporin possibly increased by dasatinib; plasma concentration of simvastatin increased by imatinib
- Eltrombopag: plasma concentration of rosuvastatin increased by eltrombopag (consider reducing dose of rosuvastatin)
- Grapefruit juice: plasma concentration of atorvastatin possibly increased by grapefruit juice; plasma concentration of simvastatin increased by grapefruit juice—avoid concomitant use
- Hormone Antagonists: possible increased risk of myopathy when simvastatin given with danazol
- Lipid-regulating Drugs: increased risk of myopathy when statins given with fenofibrate (preferably avoid concomitant use); increased risk of myopathy when statins given with fibrates; increased risk of myopathy when statins given with niacin (applies to lipid regulating doses of nicotinic acid)
- Oestrogens: atorvastatin and rosuvastatin increase plasma concentration of ethinylestradiol

Antifungals
- Anticoagulants: increased risk of toxicity when stavudine given with danazol; possibly increased risk of toxicity when stavudine given with ribavirin; effects of stavudine possibly inhibited by zidovudine (manufacturers advise avoid concomitant use)
- Cytotxics: effects of stavudine possibly inhibited by doxorubicin, increased risk of toxicity when stavudine given with hydroxy carbamide—avoid concomitant use

Stavudine
- Antivirals: increased risk of side-effects when stavudine given with didanosine; increased risk of toxicity when stavudine given with ribavirin; effects of stavudine possibly inhibited by zidovudine (manufacturers advise avoid concomitant use)
- Cytotoxics: effects of stavudine possibly inhibited by doxorubicin, increased risk of toxicity when stavudine given with hydroxy carbamide—avoid concomitant use

Stiripentol
- Antiepileptics: possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); antiepileptic effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with St John’s Wort
- Antiepileptics: stiripentol increases plasma concentration of carbamazepine and phenytoin
- Antimalarias: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of anti-epileptics antagonised by mefloquine
- Anticonvulsants: sulthiame possibly reduces plasma concentration of carbamazep
- Barbiturates: stiripentol increases plasma concentration of phenobarbital
- Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat

Streptomycin see Aminoglycosides

Stromyrtium Ranelate
- Antibacterials: stromyrtium ranelate reduces absorption of quinolones and tetracyclines (manufacturer of stromyrtium ranelate advises avoid concomitant use)

Sucralfate
- Antibacterials: sucralfate reduces absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin, ofloxacin and tetracyclines
- Anticoagulants: sucralfate possibly reduces absorption of warfarin (manufacturer of warfarin advises avoid concomitant use)

Sulfadiazine see Sulfonamides
Sulfadoxine see Sulfonamides
Sulfamethoxazole see Sulfonamides
Sulphasalazine see Aminosaliclylates
**Anticoagulants:** effects of sulfinpyrazone antagonised by aspirin

**Antibacterials:** sulfinpyrazone reduces excretion of nitrofurantoin (increased risk of toxicity); sulfinpyrazone reduces excretion of penicillins; effects of sulfinpyrazone antagonised by pyrazinamide

**Anti-coagulants:** sulfinpyrazone enhances anticoagulant effect of coumarins

**Antidiabetics:** sulfinpyrazone enhances effects of oral antidiabetics

**Antiepileptics:** sulfinpyrazone increases plasma concentration of phenytoin

**Ciclosporin:** sulfinpyrazone reduces plasma concentration of ciclosporin

**Theophylline:** sulfinpyrazone reduces plasma concentration of theophylline

**Sulfonamides**

Anaesthetics, General: sulphonamides enhance effects of thiopental

Anaesthetics, Local: increased risk of methaemoglobinemia when sulphonamides given with prilocaine

Anti-arrhythmics: increased risk of ventricular arrhythmias when sulfamethoxazole (as co-trimoxazole) given with amiodarone—avoid concomitant use of co-trimoxazole

Antibacterials: increased risk of crystalluria when sulphonamides given with metmetamidine

Anticoagulants: sulphonamides enhance anticoagulant effect of coumarins; sulphonamides possibly inhibit metabolism of phenindione

Antidiabetics: sulphonamides rarely enhance the effects of sulfonylureas

Antiepileptics: sulphonamides possibly increase plasma concentration of phenytoin

Antimalarials: increased antifolate effect when sulphonamides given with pyrimethamine

**Anticoagulants:** avoid concomitant use of cytotoxics possibly reduce absorption of phenytoin

**Alpha-blockers:** avoid concomitant use of adrenaline (epinephrine) or noradrenaline (norepinephrine) given with clonidine; serious adverse events reported with concomitant use of methylphenidate (pharmacokinetics not established)

**Alcohol:** enhanced vasopressor effect

**Anaesthetics:** sympathomimetics given with doxapram

**Antacids:** effects of antidepressants (SSRIs and tricyclics) antagonised by antipsychotics; dexamfetamine possibly antagonises antipsychotic effects of chlorpromazine; methylphenidate possibly increases side-effects of risperidone

**Antivirals:** plasma concentration of dexamfetamine possibly increased by ritalin

**Antihistamines:** effects of sympathomimetics antagonised by antihistamines

**Antihypertensives:** sympathomimetics antagonised by antihypertensives

**Antipsychotics:** sympathomimetics antagonised by antipsychotics

**Anticoagulants:** increased risk of hypertension when methylphenidate given with volatile liquids

**Antidepressants:** sympathomimetics antagonised by antidepressants

**Antidiabetics:** sympathomimetics antagonised by antidiabetics

**Antihistamines:** sympathomimetics antagonised by antihistamines

**Anticoagulants:** sympathomimetics antagonised by anticoagulants

**Antihypertensives:** sympathomimetics antagonised by antihypertensives

**Antipsychotics:** sympathomimetics antagonised by antipsychotics

**Anticoagulants:** sympathomimetics antagonised by anticoagulants

**Antihypertensives:** sympathomimetics antagonised by antihypertensives

**Antipsychotics:** sympathomimetics antagonised by antipsychotics

**Anticoagulants:** sympathomimetics antagonised by anticoagulants

**Antihypertensives:** sympathomimetics antagonised by antihypertensives

**Antipsychotics:** sympathomimetics antagonised by antipsychotics

**Anticoagulants:** sympathomimetics antagonised by anticoagulants

**Antihypertensives:** sympathomimetics antagonised by antihypertensives

**Antipsychotics:** sympathomimetics antagonised by antipsychotics

**Anticoagulants:** sympathomimetics antagonised by anticoagulants

**Antihypertensives:** sympathomimetics antagonised by antihypertensives

**Antipsychotics:** sympathomimetics antagonised by antipsychotics

**Anticoagulants:** sympathomimetics antagonised by anticoagulants

**Antihypertensives:** sympathomimetics antagonised by antihypertensives

**Antipsychotics:** sympathomimetics antagonised by antipsychotics

**Anticoagulants:** sympathomimetics antagonised by anticoagulants

**Antihypertensives:** sympathomimetics antagonised by antihypertensives

**Antipsychotics:** sympathomimetics antagonised by antipsychotics

**Anticoagulants:** sympathomimetics antagonised by anticoagulants

**Antihypertensives:** sympathomimetics antagonised by antihypertensives

**Antipsychotics:** sympathomimetics antagonised by antipsychotics

**Anticoagulants:** sympathomimetics antagonised by anticoagulants

**Antihypertensives:** sympathomimetics antagonised by antihypertensives

**Antipsychotics:** sympathomimetics antagonised by antipsychotics

**Anticoagulants:** sympathomimetics antagonised by anticoagulants

**Antihypertensives:** sympathomimetics antagonised by antihypertensives

**Antipsychotics:** sympathomimetics antagonised by antipsychotics

**Anticoagulants:** sympathomimetics antagonised by anticoagulants

**Antihypertensives:** sympathomimetics antagonised by antihypertensives

**Antipsychotics:** sympathomimetics antagonised by antipsychotics

**Anticoagulants:** sympathomimetics antagonised by anticoagulants

**Antihypertensives:** sympathomimetics antagonised by antihypertensives

**Antipsychotics:** sympathomimetics antagonised by antipsychotics

**Anticoagulants:** sympathomimetics antagonised by anticoagulants

**Antihypertensives:** sympathomimetics antagonised by antihypertensives

**Antipsychotics:** sympathomimetics antagonised by antipsychotics

**Anticoagulants:** sympathomimetics antagonised by anticoagulants

**Antihypertensives:** sympathomimetics antagonised by antihypertensives

**Antipsychotics:** sympathomimetics antagonised by antipsychotics

**Anticoagulants:** sympathomimetics antagonised by anticoagulants

**Antihypertensives:** sympathomimetics antagonised by antihypertensives

**Antipsychotics:** sympathomimetics antagonised by antipsychotics

**Anticoagulants:** sympathomimetics antagonised by anticoagulants

**Antihypertensives:** sympathomimetics antagonised by antihypertensives

**Antipsychotics:** sympathomimetics antagonised by antipsychotics

**Anticoagulants:** sympathomimetics antagonised by anticoagulants

**Antihypertensives:** sympathomimetics antagonised by antihypertensives

**Antipsychotics:** sympathomimetics antagonised by antipsychotics

**Anticoagulants:** sympathomimetics antagonised by anticoagulants

**Antihypertensives:** sympathomimetics antagonised by antihypertensives

**Antipsychotics:** sympathomimetics antagonised by antipsychotics

**Anticoagulants:** sympathomimetics antagonised by anticoagulants

**Antihypertensives:** sympathomimetics antagonised by antihypertensives
Antibacterials: metabolism of salmefoterol inactivated by ketoconazole (increased plasma concentration)

Atomoxetine: increased risk of cardiovascular side-effects when paroxetine and salbutamol given with atomoxetine

Cardiac Glycosides: increased risk of hypokalaemia when high doses of beta, sympathomimetics given with corticosteroids—see Hypokalaemia, p. 176

Diuretics: increased risk of hypokalaemia when high doses of beta, sympathomimetics given with acetazolamide, loop diuretics and thiazides and related diuretics—see Hypokalaemia, p. 176

Methyldopa: acute hypotension reported when infusion of salbutamol given with methyldopa

Muscle relaxants: bantualone enhances effects of suxamethonium

Theophylline: increased risk of hypokalaemia when high doses of beta, sympathomimetics given with theophylline—see Hypokalaemia, p. 176

Tacrolimus

Note: Interactions do not generally apply to tacrolimus used topically. topical risk of facial flushing and skin irritation with alcohol consumption (p. 722) does not apply to tacrolimus taken systemically

Analgesics: possible increased risk of nephrotoxicity when tacrolimus given with NSAIDs; increased risk of nephrotoxicity when tacrolimus given with ibuprofen

Angiotensin-II Receptor Antagonists: no increased risk of nephrotoxicity when tacrolimus given with angiotensin-II receptor antagonists

Anti-arrhythmics: caution with tacrolimus advised by manufacturer of dronedarone

Antibacterials: plasma concentration of tacrolimus increased by clarithromycin and erythromycin; plasma concentration of tacrolimus possibly reduced by rifabutin; increased risk of nephrotoxicity when tacrolimus given with aminoglycosides; plasma concentration of tacrolimus possibly increased by chloramphenicol and miltefosin; possible increased risk of nephrotoxicity when tacrolimus given with vancomycin

Antidepressants: plasma concentration of tacrolimus reduced by St John's wort—avoid concomitant use

Antiepileptics: plasma concentration of tacrolimus reduced by phenytoin, also plasma concentration of phenytoin possibly increased

Antifungals: plasma concentration of tacrolimus increased by fluconazole, itraconazole, ketoconazole, posaconazole and voriconazole (consider reducing dose of tacrolimus); increased risk of nephrotoxicity when tacrolimus given with amphotericin; plasma concentration of tacrolimus reduced by espofungin; plasma concentration of tacrolimus possibly increased by midazoles

Antipsychotics: avoidance of tacrolimus advised by manufacturer of droperidol (risk of venicular arrhythmias)

Antivirals: possible increased risk of nephrotoxicity when tacrolimus given with aciclovir or ganciclovir; plasma concentration of tacrolimus possibly increased by azidovir or zidovir; plasma concentration of tacrolimus possibly affected by revir; plasma concentration of tacrolimus increased by fosamprenavir; plasma concentration of tacrolimus increased by saquinavir (consider reducing dose of tacrolimus)

Barbiturates: plasma concentration of tacrolimus reduced by phenobarbitol

Calcium-channel Blockers: plasma concentration of tacrolimus possibly increased by felodipine, nicardipine and verapamil; plasma concentration of tacrolimus increased by alitazem and nifedipine

Tacrolimus

(continued)

Ciclosporin: tacrolimus increases plasma concentration of ciclosporin (increased risk of nephrotoxicity—avoid concomitant use)

Diuretics: increased risk of hyperkalaemia when tacrolimus given with potassium-sparing diuretics and aldosterone antagonists

Grapefruit Juice: plasma concentration of tacrolimus increased by grapefruit juice

Hormone Antagonists: plasma concentration of tacrolimus possibly increased by danazol

Mifamurtide: avoidance of tacrolimus advised by manufacturer of mifamurtide

Oestrogens: plasma concentration of tacrolimus possibly increased by ethinylestradiol

Potassium Salts: increased risk of hyperkalaemia when tacrolimus given with potassium salts

Sevelamer: plasma concentration of tacrolimus possibly reduced by sevelamer

Ulcer Healing Drugs: plasma concentration of tacrolimus possibly increased by omeprazole

Tadalafil

Alpha-blockers: enhanced hypertensive effect when tadalafil given with doxazosin—manufacturer of tadalafil advises avoid concomitant use; enhanced hypertensive effect when tadalafil given with alpha-blockers—see also p. 515

Antibacterials: plasma concentration of tadalafil possibly increased by clarithromycin and erythromycin; plasma concentration of tadalafil reduced by rifampicin—manufacturer of tadalafil advises avoid concomitant use

Antivirals: plasma concentration of tadalafil possibly increased by fosamprenavir and indinavir; plasma concentration of tadalafil increased by ritonavir—manufacturer of tadalafil advises avoid concomitant use; increased risk of venicular arrhythmias when tadalafil given with saquinavir—avoid concomitant use

Bosentan: plasma concentration of tadalafil reduced by bosentan

Grapefruit Juice: plasma concentration of tadalafil possibly increased by grapefruit juice

Nicarandil: tadalafil significantly enhances hypertensive effect of nicarandil (avoid concomitant use)

Nitrates: tadalafil significantly enhances hypertensive effect of nitrates (avoid concomitant use)

Tamoxifen

Antibacterials: metabolism of tamoxifen accelerated by rifampicin (reduced plasma concentration)

Anticoagulants: tamoxifen enhances anticoagulant effect of coumarins

Antidepressants: metabolism of tamoxifen to active metabolite possibly inhibited by fluoxetine and paroxetine (avoid concomitant use)

Antipsychotics: avoidance of tamoxifen advised by manufacturer of droperidol (risk of venicular arrhythmias)

BuPROPion: metabolism of tamoxifen to active metabolite possibly inhibited by BuPROPion (avoid concomitant use)

CINacalcet: metabolism of tamoxifen to active metabolite possibly inhibited by cinacalcet (avoid concomitant use)

Tamulosin see Alpha-blockers

Taxanes see Docetaxel and Paclitaxel

TeGafur with uraci1 see Fluorouracil

TeCoPlaIn: Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 767

Telbivudine

Interferons: increased risk of peripheral neuropathy when telbivudine given with interferon alfa
Telithromycin

Analgesics: telithromycin inhibits the metabolism of oxycodeone.

- Anti-arrhythmics: avoidance of telithromycin advised by manufacturer of dronedarone (risk of ventricular arrhythmias).
- Anti-infective agents: plasma concentration of telithromycin reduced by rifampicin (avoid during and for 2 weeks after rifampicin).
- Antidepressants: plasma concentration of telithromycin reduced by St John’s wort (avoid during and for 2 weeks after St John’s wort).
- Anti-infective agents: plasma concentration of telithromycin reduced by carbamazepine, phenytoin and primidone.
- Anti-infective agents: manufacturer of telithromycin advises concomitant use with azithromycin in severe renal and hepatic impairment.
- Anti-infective agents: manufacturer of fosoterodine advises dose reduction when telithromycin given with fosoterodine—consult fosoterodine product literature.
- Anti-infective agents: increased risk of ventricular arrhythmias when telithromycin given with pimozide—avoid concomitant use.
- Anti-infective agents: manufacturer of telithromycin advises concomitant use with lansoprazole (increased risk of myopathy when telithromycin given with lansoprazole).
- Anti-infective agents: increased plasma concentration of telithromycin possibly increased by furosemide (consider reducing dose of furosemide).
- Anti-infective agents: telithromycin inhibits metabolism of midazolam (increased plasma concentration with increased sedation).
- Anti-infective agents: aprepitant: telithromycin possibly increases plasma concentration of aprepitant.
- Anti-infective agents: barbiturates: plasma concentration of telithromycin reduced by phenobarbital (avoid during and for 2 weeks after phenobarbital).
- Anti-infective agents: cardiac glycosides: telithromycin possibly increases plasma concentration of digoxin.
- Anti-infective agents: ciclosporin: telithromycin possibly increases plasma concentration of ciclosporin.
- Anti-infective agents: colchicine: telithromycin possibly increases risk of colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment).
- Anti-infective agents: cytoxotics: telithromycin possibly increases plasma concentration of everolimus—manufacturer of everolimus advises avoid concomitant use; avoidance of telithromycin advised by manufacturer of pazopanib and apixaban and pazopanib and apixaban.
- Anti-infective agents: diuretics: telithromycin increases plasma concentration of espererone—avoid concomitant use.
- Anti-infective agents: ergot alkaloids: increased risk of ergotism when telithromycin given with ergotamine and methysergide—avoid concomitant use.
- Anti-infective agents: ibaviridine: telithromycin possibly increases plasma concentration of ibaviridine—avoid concomitant use.
- Anti-infective agents: lipid-regulating Drugs: increased risk of myopathy when telithromycin given with stavudine or simvastatin (avoid concomitant use); possible increased risk of myopathy when telithromycin given with pravastatin.
- Anti-infective agents: ranolazine: telithromycin possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use.
- Anti-infective agents: sildenafil: telithromycin possibly increases plasma concentration of sildenafil—reduce initial dose of sildenafil.
- Anti-infective agents: sirolimus: telithromycin increases plasma concentration of sirolimus—avoid concomitant use.
- Anti-infective agents: tacrolimus: telithromycin possibly increases plasma concentration of tacrolimus.

Telithromycin (continued)

Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 767.

Telmisartan see Angiotensin-II Receptor Antagonists.

Temazepam see Anxiolytics and Hypnotics.

Temocilin see Penicillins.

Temoporfin
- Cytotoxics: increased skin photosensitivity when temoporfin given with topical fluourouracil.

Temozolomide
- Antiepileptics: cytoxotics possibly reduced absorption of phenytoin; plasma concentration of temozolomide increased by valproate.
- Anti-infective agents: avoid concomitant use of cytoxotics with oxazepine (increased risk of agranulocytosis).
- Cardiac Glycosides: cytoxotics reduce absorption of digoxin tablets.

Temsirolimus

Note: The main active metabolite of temsirolimus is sirolimus—see also interactions of sirolimus and consult product literature.
- Anti-infective agents: plasma concentration of active metabolite of temsirolimus reduced by rifampicin—avoid concomitant use.
- Anti-infective agents: cytoxotics possibly reduced absorption of phenytoin.
- Anti-infective agents: plasma concentration of active metabolite of temsirolimus increased by furosemide—avoid concomitant use.
- Anti-infective agents: phenytoin: plasma concentration of temozolomide increased by valproate.
- Anti-infective agents: phenytoin: plasma concentration of temozolomide increased by valproate.

Tenofvir

- Anti-infective agents: manufacturer of tenofovir advises avoid concomitant use with adeovir; tenofovir reduces plasma concentration of atazanavir, also plasma concentration of tenofovir possibly increased; manufacturers advise avoid concomitant use of tenofovir with adeovir; tenofovir increases plasma concentration of didanosine (increased risk of toxicity)—avoid concomitant use; plasma concentration of tenofovir increased by lopinavir.

Tenoxicam see NSAIDs.

Terazosin see Alpha-blockers.

Terbinafine
- Anti-infective agents: plasma concentration of terbinafine reduced by rifampicin.
- Antidepressants: terbinafine possibly increases plasma concentration of tricyclics.
- Ciclosporin: terbinafine possibly reduces plasma concentration of ciclosporin.
- Diuretics: terbinafine possibly increases plasma concentration of metolazone and furosemide—avoid concomitant use.
- Diuretics: terbinafine possibly increases plasma concentration of metolazone and furosemide—avoid concomitant use.
- Lipid-regulating Drugs: increased risk of myopathy when telithromycin given with atorvastatin or simvastatin (avoid concomitant use); possible increased risk of myopathy when telithromycin given with pravastatin.
- Ranolazine: telithromycin possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use.
- Sildenafil: telithromycin possibly increases plasma concentration of sildenafil—reduce initial dose of sildenafil.
- Sirolimus: telithromycin increases plasma concentration of sirolimus—avoid concomitant use.
- Tacrolimus: telithromycin possibly increases plasma concentration of tacrolimus.
Tetrabenazine (continued) Metoclopramide: increased risk of extrapyramidal side-effects when tetrabenazine given with metoclopramide

Tetracosactide see Corticosteroids

Tetracycline see Tetracyclines

Tetracyclines

ACE Inhibitors: absorption of tetracyclines reduced by quinapril tablets (quinapril tablets contain magnesium carbonate)

Adsorbents: absorption of tetracyclines possibly reduced by kaolin

Antacids: absorption of tetracyclines reduced by antacids

Antibacterials: plasma concentration of doxycycline reduced by rifampicin—consider increasing dose of doxycycline; tetracyclines possibly antagonise effects of penicillins

Anticoagulants: metabolism of doxycycline accelerated by warfarin; metabolism of tetracycline accelerated by phenytoin and primidone (reduced plasma concentration)

Atovaquone: tetracycline reduces plasma concentration of atovaquone

Barbiturates: metabolism of doxycycline accelerated by barbiturates (reduced plasma concentration)

Calcium Salts: absorption of tetracycline reduced by calcium salts

Ciclosporin: doxycycline or tetracycline increase risk of hyperkalaemia when theophylline given with ciclosporin

Dairy Products: absorption of tetracyclines (except doxycycline and minocycline) reduced by dairy products

Diuretics: manufacturer of lymecycline advises avoid concomitant use with diuretics

Ergot Alkaloids: increased risk of ergotism when tetracyclines given with ergotamine and methysergide

Iron: absorption of tetracyclines reduced by oral iron, also absorption of oral iron reduced by tetracyclines

Lipid-regulating Drugs: absorption of tetracycline possibly reduced by colestipol and colestyramine

Retinoids: possible increased risk of benign intracranial hypertension when tetracyclines given with retinoids (avoid concomitant use)

Strontium Ranelate: absorption of tetracyclines reduced by strontium ranelate (manufacturer of strontium ranelate advises avoid concomitant use)

Ulcer-healing Drugs: absorption of tetracyclines reduced by sucralfate and tripotassium dicitratobismuthate

Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 767

Zinc: absorption of tetracyclines reduced by zinc, also absorption of zinc reduced by tetracyclines

Theophylline

Allopurinol: plasma concentration of theophylline possibly increased by allopurinol

Anaesthetics, General: increased risk of convulsions when theophylline given with ketamine; increased risk of arrhythmias when theophylline given with halothane

Anti-arrhythmics: theophylline antagonises anti-arrhythmic effect of adenosine; plasma concentration of theophylline increased by propafenone

Antibacterials: plasma concentration of theophylline possibly increased by azithromycin and clarithromycin; metabolism of theophylline inhibited by fluvoxamine (concomitant use should usually be avoided, but where not possible halve theophylline dose and monitor plasma-theophylline concentration); plasma concentration of theophylline reduced by St John’s wort—avoid concomitant use

Antiepileptics: metabolism of theophylline accelerated by carbamazepine and primidone (reduced effect); plasma concentration of both drugs reduced when theophylline given with phenytoin

Antifungals: plasma concentration of theophylline possibly increased by fluconazole and ketoconazole

Antivirals: plasma concentration of theophylline possibly increased by aciclovir; metabolism of theophylline accelerated by ritonavir (reduced plasma concentration)

Antithrombotics: theophylline possibly reduced by warfarin

Anticoagulants: metabolism of theophylline reduced by warfarin

Barbiturates: metabolism of theophylline accelerated by barbiturates (reduced effect)

Calcium-channel Blockers: plasma concentration of theophylline possibly increased by verapamil (enhanced effect)

Corticosteroids: increased risk of hypokalaemia when theophylline given with corticosteroids

Cytoxics: plasma concentration of theophylline possibly increased by methotrexate

Disulfiram: metabolism of theophylline inhibited by disulfiram (increased risk of toxicity)

Diuretics: increased risk of hypokalaemia when theophylline given with acetazolamide, loop diuretics or thiazides and related diuretics

Doxapram: increased CNS stimulation when theophylline given with doxapram

Febuxostat: caution with theophylline advised by manufacturer of febuxostat

Interferons: metabolism of theophylline inhibited by interferon alfa (consider reducing dose of theophylline)

Leukotriene Receptor Antagonists: plasma concentration of theophylline possibly increased by zafirlukast, also plasma concentration of zafirlukast reduced

Lithium: theophylline increases excretion of lithium (reduced plasma concentration)

Oestrogens: excretion of theophylline reduced by oestrogens (increased plasma concentration)

Pentoxifylline: plasma concentration of theophylline increased by pentoxifylline

Roflumilast: avoidance of theophylline advised by manufacturer of roflumilast

Sulfapyrazine: plasma concentration of theophylline reduced by sulfapyrazine

Sympathomimetics: manufacturer of theophylline advises avoid concomitant use with ephedrine in children

Sympathomimetics, Beta2: increased risk of hypokalaemia when theophylline given with high doses of beta, sympathomimetics—see Hypokalaemia, p. 176

Ulcer-healing Drugs: metabolism of theophylline inhibited by rimoxidine (increased plasma concentration); absorption of theophylline possibly reduced by sucralfate (give at least 2 hours apart)
Theophylline (continued)

Vaccines: plasma concentration of theophylline possibly increased by influenza vaccine

Thiazolidinediones see Antidiabetics

Thiopental see Anaesthetics, General

Thiotepa

Antineoplastic: cytotoxic possibly reduced absorption of phenytoin

Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxic reduces absorption of digoxin tablets

Muscle Relaxants: thiopenta enhances effects of suxamethonium

Thioxanthenes see Antipsychotics

Thyroid Hormones

Antacids: absorption of levothyroxine possibly reduced by antacids

Anti-arrhythmics: for concomitant use of thyroid hormones and amiodarone see p. 94

Antibacterials: metabolism of levothyroxine accelerated by rifampicin (may increase requirements for levothyroxine in hypothyroidism)

Anticoagulants: thyroid hormones enhance anti-coagulant effect of coumarins and phenindione

Antidepressants: thyroid hormones enhance effects of amitriptyline and imipramine; thyroid hormones possibly enhance effects of tricyclics

Antiepileptics: metabolism of thyroid hormones accelerated by carbamazepine and primidone (may increase requirements for thyroid hormones in hypothyroidism); metabolism of thyroid hormones accelerated by phenytoin (may increase requirements in hypothyroidism), also plasma concentration of phenytoin possibly increased

Barbiturates: metabolism of thyroid hormones accelerated by barbiturates (may increase requirements for thyroid hormones in hypothyroidism)

Beta-blockers: levothyroxine accelerates metabolism of propranolol

Calcium Salts: absorption of levothyroxine reduced by calcium salts

Cytotoxics: plasma concentration of levothyroxine possibly reduced by imatinib

Iron: absorption of levothyroxine reduced by oral iron (give at least 2 hours apart)

Lanthanum: absorption of levothyroxine reduced by lanthanum (give at least 2 hours apart)

Lipid-regulating Drugs: absorption of levothyroxine reduced by colestipol; absorption of thyroid hormones reduced by colestipol and colestyramine

Oestrogens: requirements for thyroid hormones in hypothyroidism may be increased by oestrogens

Orlistat: possible increased risk of hypothyroidism when levothyroxine given with orlistat

Polystyrene Sulphonate Resins: absorption of levothyroxine reduced by polystyrene sulphonate resins

Sevelamer: absorption of levothyroxine possibly reduced by sevelamer

Ulcer-healing Drugs: absorption of levothyroxine reduced by cimetidine and sucralfate

Tiagabine (continued)

Barbiturates: plasma concentration of tiagabine reduced by phenobarbital

Orlistat: possible increased risk of convulsions when anti-epileptics given with orlistat

Tiapronenid see NSAIDs

Tibolone

Antibacterials: metabolism of tibolone accelerated by carbamazepine and primidone (reduced plasma concentration); metabolism of tibolone accelerated by phenytoin

Barbiturates: metabolism of tibolone accelerated by barbiturates (reduced plasma concentration)

Ticarcillin see Penicillins

Tigecycline

Antiepileptics: cytotoxic possibly reduces anti-coagulant effect of coumarins

Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 787

Tiludronic Acid see Bisphosphonates

Timolol see Beta-blockers

Tinidazole

Alcohol: possibility of disulfiram-like reaction when tinidazole given with alcohol

Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 787

Tinzaparin see Heparins

Tioguanine

Antiepileptics: cytotoxic possibly reduces absorption of phenytoin

Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxic reduces absorption of digoxin tablets

Cytotoxics: increased risk of hepatotoxicity when tioguanine given with busulfan

Tiotropium see Antimuscarinics

Tipranavir

Analgesics: plasma concentration of tipranavir possibly reduced by buprenorphine

Antacids: absorption of tipranavir reduced by antacids

Antibacterials: tipranavir increases plasma concentration of clarithromycin (reduced dose of clarithromycin in renal impairment), also plasma concentration of tipranavir increased by clarithromycin; tipranavir increases plasma concentration of rifabutin (reduce dose of rifabutin); plasma concentration of tipranavir possibly reduced by rifampicin—avoid concomitant use; avoidance of concomitant tipranavir in severe renal and hepatic impairment advised by manufacturer of tipranavir

Anticoagulants: avoid of tipranavir advised by manufacturer of rivaroxaban

Antidepressants: plasma concentration of tipranavir possibly reduced by St John's wort—avoid concomitant use

Antiepileptics: plasma concentration of tipranavir possibly reduced by carbamazepine

Antifungals: plasma concentration of tipranavir increased by fluconazole

Antimalarials: caution with tipranavir advised by manufacturer of artesunate/lumefantrine; tipranavir possibly increases plasma concentration of quinine (increased risk of toxicity)

Antimuscarinics: avoidance of tipranavir advised by manufacturer of darifenacin

Antivirals: tipranavir reduces plasma concentration of abacavir, didanosine, fosamprenavir, lopinavir, saquinavir and zidovudine; plasma concentration of tipranavir increased by atazanavir (also plasma concentration of atazanavir reduced); tipranavir reduces plasma concentration of etravirine, also plasma concentration of tipranavir increased (avoid concomitant use)
Appendix 1: Interactions

Orlistat:

Oestrogens:

Antiepileptics:

Antidepressants:

Topiramate.

Grapefruit Juice:

Tolfenamic Acid

Tolcapone

Tolbutamide

see

Vaccines:

Tocilizumab

see

Tobramycin

see

Tirofiban

Ulcer-healing Drugs:

Ranolazine:

Beta-blockers:

(continued)

886 Appendix 1: Interactions BNF 61

possible increased risk of convulsions

plasma concentration of topiramate

manufacturer of topiramate advises avoid concomitant use

Topiramate possibly affects plasma concentration of omeprazole

Antidiabetics possibly antagonised by MAOIs and tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with St John's wort

Antidiabetics: topramate possibly increases plasma concentration of metformin or tiglurmine—avoid concomitant use

Antiepileptics: plasma concentration of topiramate often reduced by carbamazepine; topiramate possibly increases plasma concentration of phenytoin (also plasma concentration of topiramate reduced); CNS toxicity reported when topiramate given with valproate

Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by nefedipine

Diuretics: plasma concentration of topiramate possibly increased by hydrochlorothiazide

Lithium: topramate possibly affects plasma concentration of lithium

Oestrogens: topramate accelerates metabolism of oestrogens (reduced contraceptive effect—see p. 495)

Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat

Topiramate (continued)

Progesterons: topramate accelerates metabolism of progesterons (reduced contraceptive effect—see p. 495)

Terasemide see Diuretics

Toremifene

Anticoagulants: toremifene possibly enhances anti-coagulant effect of coumarins

Antiepileptics: metabolism of toremifene possibly accelerated by carbamazepine (reduced plasma concentration); metabolism of toremifene possibly accelerated by phenytoin; metabolism of toremifene accelerated by primidone (reduced plasma concentration)

Barbiturates: metabolism of toremifene possibly accelerated by barbiturates (reduced plasma concentration)

Diuretics: increased risk of hypercalcaemia when toremifene given with thiazides and related diuretics

Sugammadex: toremifene possibly reduces response to sugammadex

Trabectedin

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Tramadol see Opioid Analgesics

Trandolapril see ACE Inhibitors

Tranylcypromine see MAOIs

Trazodone see Antidepressants, Tricyclic (related)

Tretinoin see Retinoids

Triamcinolone see Corticosteroids

Triamterene see Diuretics

Tricyclols see Anxiolytics and Hypnotics

Trientine

Iron: trientine reduces absorption of oral iron

Zinc: trientine reduces absorption of zinc, also absorption of trientine reduced by zinc

Trifluoperazine see Antipsychotics

Trihexyphenidyl see Antimuscarinics

Triostane: Diuretics: increased risk of hyperkalaemia when triostane given with potassium-sparing diuretics and aldosterone antagonists

Trimesthropin

ACE Inhibitors: possible increased risk of hyperkalaemia when trimesthropin given with ACE inhibitors

Angiotensin-II Receptor Antagonists: possible increased risk of hyperkalaemia when trimesthropin given with angiotensin-II receptor antagonists

Anti-arrhythmics: increased risk of ventricular arrhythmias when trimesthropin (as co-trimoxazole) given with amiodarone—avoid concomitant use of co-trimoxazole

Antibacterials: plasma concentration of trimethoprim possibly reduced by rifampicin; plasma concentration of both drugs may increase when trimesthropin given with dapsoné

Anticoagulants: trimesthropin possibly enhances anti-coagulant effect of coumarins

Antidiabetics: trimesthropin possibly enhances hypoglycaemic effect of repaglinide—manufacturer advises avoid concomitant use; trimesthropin rarely enhances the effects of sulfonylureas

Antiepileptics: trimesthropin increases plasma concentration of phenytoin (also increased anticonvulsant effect)

Antiarrhythmals: increased antifolate effect when trimesthropin given with pyrimethamine

Antivirals: trimesthropin (as co-trimoxazole) increases plasma concentration of lamivudine—avoid concomitant use of high-dose co-trimoxazole

Azathioprine: increased risk of haematological toxicity when trimesthropin (also with co-trimoxazole) given with azathioprine
Trimestoprim (continued)
Cardiac Glycosides: trimethoprim possibly increases plasma concentration of digoxin
- Ciclosporin: increased risk of nephrotoxicity when trimethoprim given with ciclosporin, also plasma concentration of ciclosporin reduced by intravenous trimethoprim
- Cytoxotics: increased risk of haematological toxicity when trimethoprim (also with co-trimazole) given with mercaptopurine or methotrexate
Diuretics: increased risk of hyperkalaemia when trimethoprim given with eplerenone
Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 767
Trimepramine see Antidepressants, Tricyclic
Triptosatium Dicitratobismuthate
Antibacterials: triptosatium dicitratobismuthate reduces absorption of tetracyclines
Tropismide see Antimuscarinics
Trophicum see Antimuscarinics
Trimethoprim
- Antidepressants: CNS toxicity reported when tryptophan given with fluoxetine; possible increased serotonergic effects when tryptophan given with duloxetine; CNS excitation and confusion when tryptophan given with MAOIs (reduce dose of tryptophan); agitation and nausea may occur when tryptophan given with SSRIs
- Antimalarias: avoidance of antidepressants advised by manufacturer of atomoxetine
- Atomsoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine
Typhoon Vaccine (oral) see Vaccines
Typhoon Vaccine (parenteral) see Vaccines
Ube dicarone
Anticoagulants: ubedicarone may enhance or reduce anticoagulant effect of warfarin
Ulcer-healing Drugs see Histamine H2 -antagonists, Proton Pump Inhibitors, Sucralfate, and Tripotassium Dicitratobismuthate
Ulprilstal
- Antacids: manufacturer of ulprilstal advises avoid concomitant use with antacids (plasma concentration of ulprilstal possibly reduced)
- Antibacterials: manufacturer of ulprilstal advises avoid concomitant use with ulprilstal (contraceptive effect of ulprilstal possibly reduced)
- Antidepressants: manufacturer of ulprilstal advises avoid concomitant use with St John’s Wort (contraceptive effect of ulprilstal possibly reduced)
- Antiepileptics: manufacturer of ulprilstal advises concomitant use with carbamazepine and phenytoin (contraceptive effect of ulprilstal possibly reduced)
- Antivirals: manufacturer of ulprilstal advises avoid concomitant use with mitonavir (contraceptive effect of ulprilstal possibly reduced)
- Barbiturates: manufacturer of ulprilstal advises avoid concomitant use with phenobarbital (contraceptive effect of ulprilstal possibly reduced)
- Progestogens: ulprilstal possibly reduces contraceptive effect of progestogens
- Ulcer-healing Drugs: manufacturer of ulprilstal advises avoid concomitant use with histamine H2 -antagonists and proton pump inhibitors (plasma concentration of ulprilstal possibly reduced)
Urso deoxycholic Acid
Antacids: absorption of bile acids possibly reduced by antacids
- Ciclosporin: urso deoxycholic acid increases absorption of ciclosporin
Lipid-regulating Drugs: absorption of bile acids possibly reduced by colestipol and colestyramine
Oestrogens: elimination of cholesterol in bile increased when bile acids given with oestrogens
Ustekinumab
- Vaccines: avoid concomitant use of ustekinumab with live vaccines (see p. 746)
Vaccines
Note: For a general warning on live vaccines and high doses of corticosteroids or other immunosuppressive drugs, see p. 746; for advice on live vaccines and immunoglobulins, see under Normal Immunoglobulin, p. 769
- Abatacept: avoid concomitant use of live vaccines with abatacept (see p. 746)
- Adalimumab: avoid concomitant use of live vaccines with adalimumab (see p. 746)
- Anakinra: avoid concomitant use of live vaccines with anakinra (see p. 746)
- Antibacterials: oral typhoid vaccine inactivated by antibacterials—see p. 767
- Anticoagulants: influenza vaccine possibly enhances anticoagulant effect of warfarin
- Antiepileptics: influenza vaccine enhances effects of phenytoin
- Antimalarias: oral typhoid vaccine inactivated by antimalarias—see p. 767
- Certolizumab pegol: avoid concomitant use of live vaccines with certolizumab pegol (see p. 746)
- Corticosteroids: immune response to vaccines impaired by high doses of corticosteroids, avoid concomitant use with live vaccines (see p. 746)
- Etanercept: avoid concomitant use of live vaccines with etanercept (see p. 746)
- Golimumab: avoid concomitant use of live vaccines with golimumab (see p. 746)
- Influnixinab: avoid concomitant use of live vaccines with infliximab (see p. 746)
- Interferons: avoidance of vaccines advised by manufacturer of interferon gamma
- Lefunomide: avoid concomitant use of live vaccines with lefunomide (see p. 746)
- Theophylline: influenza vaccine possibly increases plasma concentration of theophylline
- Tolizumab: avoid concomitant use of live vaccines with tolixumab (see p. 746)
- Ustekinumab: avoid concomitant use of live vaccines with ustekinumab (see p. 746)
Valaciclovir see Aciclovir
Valganciclovir see Ganciclovir
Valporate
Analgesics: effects of valporate enhanced by aspirin
Antibacterials: metabolism of valporate possibly inhibited by erythromycin (increased plasma concentration); plasma concentration of valporate reduced by carbenepem—avoid concomitant use of anticoagulants; valporate possibly enhances anticoagulant effect of coumarins
Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclines (convulsive threshold lowered); avoid concomitant use of antiepileptics with St John’s Wort
Antiepileptics: plasma concentration of valporate reduced by carbamazepine, also plasma concentration of active metabolite of carbamazepine increased; valporate possibly increases plasma concentration of ethosuximide; valporate increases plasma concentration of lamotrigine; valporate sometimes reduces plasma concentration of an active metabolite of oxcarbazepine; valporate increases or possibly decreases plasma concentration of phenytoin, also plasma concentration of valporate reduced; valporate possibly increases plasma concentration of primidone (plasma concentration of active metabolite of primidone increased), also plasma concentration of valporate reduced; valporate possibly increases plasma concentration of rufinamide (reduce dose of rufinamide); CNS toxicity reported when valporate given with topiramate
Valproate (continued)

- Antimalarials: possible increased risk of convulsions when antimalarials are given with chloroquine and hydroxychloroquine; anticonvulsant effect of anti-malarial drugs antagonised by mefloquine.
- Antipsychotics: anticonvulsant effect of valproate antagonised by antipsychotics (convulsive threshold lowered); valproate possibly increases or decreases plasma concentration of clozapine; increased risk of side-effects including neutropenia when valproate is given with clozapine; valproate possibly increases plasma concentration of quetiapine.

Antivirals: valproate possibly increases plasma concentration of zidovudine (increased risk of toxicity).

Anxiolytics and Hypnotics: plasma concentration of valproate possibly increased by clozapine; increased risk of side-effects when valproate is given with clonazepam; valproate possibly increases plasma concentration of diazepam and lorazepam.

Barbiturates: valproate increases plasma concentration of phenobarbital (also plasma concentration of valproate reduced).

Bupropion: valproate inhibits the metabolism of bupropion.

Cytotoxic: valproate increases plasma concentration of temozolomide.

Lipid-regulating Drugs: absorption of valproate possibly reduced by colestyramine.

Oestrogens: plasma concentration of valproate possibly reduced by ethinylestradiol.

Orlistat: possible increased risk of convulsions when antiepileptics are given with orlistat.

Sodium Benzoate: valproate possibly reduces effects of sodium benzoate.

Sodium Phenylbutyrate: valproate possibly reduces effects of sodium phenylbutyrate.

Valproate increases metabolism of valproate when valproate is given with valproate.

Valsartan see Angiotensin-II Receptor Antagonists.

Vasodilator Antihypertensives

ACE Inhibitors: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside are given with ACE inhibitors.

Adrenergic Neurone Blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside are given with adrenergic neurone blockers.

Alcohol: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside are given with alcohol.

Aldesleukin: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside are given with aldesleukin.

Alpha-blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside are given with alpha-blockers.

Analgesics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside are given with general anaesthetics.

Antileukins: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside are given with nSAIDs.

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside are given with angiotensin-II receptor antagonists.

Antidepressants: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside are given with tricyclic-related antidepressants.

Antiipsychotics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside are given with phenothiazines.

Anxiolytics and Hypnotics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside are given with anxiolytics and hypnotics.

Beta-blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside are given with beta-blockers.

Calcium-channel Blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside are given with calcium-channel blockers.

Clonidine: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside are given with clonidine.

Corticosteroids: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by corticosteroids.

Diazoxide: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside are given with diuretics.

Dopaminergics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside are given with levodopa.

Doxapram see Anaesthetics, General.

Gamma-aminobutyric acid agonists: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside are given with GABA agonists.

Grapefruit Juice: plasma concentration of vardenafil possibly increased by grapefruit juice.

Hydralazine: enhanced hypotensive effect when hydralazine is given with antiepileptics, clonidine or adrenaline.

Hypnotics: enhanced hypotensive effect when hydralazine is given with hypnotics.

Lignocaine: enhanced hypotensive effect when hydralazine is given with lignocaine.

Nicorandil: enhanced hypotensive effect when hydralazine is given with nicorandil.

Oral Anticoagulants: enhanced hypotensive effect when hydralazine is given with oral anticoagulants.

Pentamidine: enhanced hypotensive effect when hydralazine is given with pentamidine.

Pentazocine: enhanced hypotensive effect when hydralazine is given with pentazocine.

Potassium-sparing Diuretics: enhanced hypotensive effect when hydralazine is given with potassium-sparing diuretics.

Probenecid: enhanced hypotensive effect when hydralazine is given with probenecid.

Radioisotopes: enhanced hypotensive effect when hydralazine is given with radioisotopes.

Suxamethonium: enhanced hypotensive effect when hydralazine is given with suxamethonium.
Antidepressants:

- Venlafaxine possibly enhances antidepressant effects when venlafaxine given with tramadol.

- Antidepressants: possible increased serotoninergic effects when venlafaxine given with St John’s wort, duloxetine or mirtazapine; enhanced toxicity when venlafaxine given with MAOIs. (venlafaxine should not be started until 2 weeks after stopping MAOIs, avoid MAOIs for 1 week after stopping venlafaxine; after stopping SSRI-related antidepressants do not start moclobemide for at least 1 week.

- Antimalarials: possible increased risk of convulsions when antidepressants given with tramadol.

- Antidepressants: enhanced hypotensive effect when venlafaxine given with lithium, possibly increased risk of convulsions when antidepressants given with tramadol.

- Antidepressants: plasma concentration of primidone possibly reduced by vigabatrin.

- Antidepressants: plasma concentration of lithium possibly increased by vigabatrin.

Antidepressants:

- Antimalarials: possible increased risk of convulsions when antidepressants given with tramadol.

- Antidepressants: possible increased risk of convulsions when antidepressants given with lithium.

Antidepressants:

- Antimalarials: possible increased risk of convulsions when antidepressants given with tramadol.

- Antidepressants: possible increased risk of convulsions when antidepressants given with lithium.

Antidepressants:

- Antimalarials: possible increased risk of convulsions when antidepressants given with tramadol.

- Antidepressants: possible increased risk of convulsions when antidepressants given with lithium.

Antidepressants:

- Antimalarials: possible increased risk of convulsions when antidepressants given with tramadol.

- Antidepressants: possible increased risk of convulsions when antidepressants given with lithium.

Antidepressants:

- Antimalarials: possible increased risk of convulsions when antidepressants given with tramadol.

- Antidepressants: possible increased risk of convulsions when antidepressants given with lithium.

Antidepressants:

- Antimalarials: possible increased risk of convulsions when antidepressants given with tramadol.

- Antidepressants: possible increased risk of convulsions when antidepressants given with lithium.

Antidepressants:

- Antimalarials: possible increased risk of convulsions when antidepressants given with tramadol.

- Antidepressants: possible increased risk of convulsions when antidepressants given with lithium.

Antidepressants:

- Antimalarials: possible increased risk of convulsions when antidepressants given with tramadol.

- Antidepressants: possible increased risk of convulsions when antidepressants given with lithium.

Antidepressants:

- Antimalarials: possible increased risk of convulsions when antidepressants given with tramadol.

- Antidepressants: possible increased risk of convulsions when antidepressants given with lithium.

Antidepressants:

- Antimalarials: possible increased risk of convulsions when antidepressants given with tramadol.

- Antidepressants: possible increased risk of convulsions when antidepressants given with lithium.

Antidepressants:

- Antimalarials: possible increased risk of convulsions when antidepressants given with tramadol.

- Antidepressants: possible increased risk of convulsions when antidepressants given with lithium.
Appendix 1: Interactions

Vitamin K (Phytomenadione) see Vitamins

Vitamins

Antibacterials: absorption of vitamin A possibly reduced by neomycin

- Anticoagulants: vitamin E possibly enhances anticoagulant effect of coumarins; vitamin K antagonises anticoagulant effect of coumarins and phenindione

Antiepileptics: vitamin D requirements possibly increased when given with carbamazepine, phenytoin or primidone

Antifungals: plasma concentration of paricalcitol possibly increased by ketoconazole

Antivirals: increased risk of bleeding when given with tizanidine

Calcium Salts: absorption of zinc reduced by calcium salts

Antibacterials:

- increased antifolate effect when zidovudine increases or decreases methotrexate concentration

Antimalarials: zidovudine increases or decreases antimalarial plasma concentration

Antiepileptics:

- anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with St John’s wort

Antiepileptics: plasma concentration of zonisamide reduced by carbamazepine and phenytoin

Antimalarials:

- possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; angioedema possibly increased by MAOIs and tricyclics

Barbiturates:

- absorption of zinc reduced by tetracyclines

Antibacterials:

- increased antifolate effect when zidovudine increases or decreases methotrexate concentration

Antimalarials: zidovudine increases or decreases antimalarial plasma concentration

Antiepileptics:

- anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with St John’s wort

Antiepileptics: plasma concentration of zonisamide reduced by carbamazepine and phenytoin

- possible increased risk of convulsions when antiepileptics given with orlistat

Zopiclone see Anxiolytics and Hypnotics

Zuclopenthixol see Antipsychotics

Zinc (continued)

Iron: absorption of zinc reduced by oral iron, also absorption of oral iron reduced by zinc

Penicillamine: absorption of zinc reduced by penicillamine, also absorption of penicillamine reduced by zinc

Trientine: absorption of zinc reduced by trientine, also absorption of trientine reduced by zinc

Zoledronic Acid see Bisphosphonates

Zomaritipan see SHT, Agonists

Zolpidem see Anxiolytics and Hypnotics

Zonisamide

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with St John’s wort

Antiepileptics: plasma concentration of zonisamide reduced by carbamazepine and phenytoin

- absorpion of vitamin A possibly increased by orlistat

Zopiclone see Anxiolytics and Hypnotics

Zuclopenthixol see Antipsychotics

Zinc

Antibacterials: zinc reduces absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin; zinc reduces absorption of tetracyclines, also absorption of zinc reduced by tetracyclines

Calcium Salts: absorption of zinc reduced by calcium salts

Eltrombopag: zinc possibly reduces absorption of eltrombopag (give at least 4 hours apart)
Liver disease, renal impairment, pregnancy, and breast-feeding

For general guidance on prescribing for patients with hepatic or renal impairment, or for patients who are pregnant or breast-feeding, see pp. 17–19. Specific information has been moved to the relevant chapters and is included under the individual drug or in the prescribing notes.
Appendix 6: Intravenous additives

Intravenous additives policies

A local policy on the addition of drugs to intravenous fluids should be drawn up by a multi-disciplinary team in each Strategic Health Authority (or equivalent) and issued as a document to the members of staff concerned.

Centralised additive services are provided in a number of hospital pharmacy departments and should be used in preference to making additions on wards.

The information that follows should be read in conjunction with local policy documents.

Guidelines

1. Drugs should only be added to infusion containers when constant plasma concentrations are needed or when the administration of a more concentrated solution would be harmful.
2. In general, only one drug should be added to any infusion container and the components should be compatible. Ready-prepared solutions should be used whenever possible. Drugs should not normally be added to blood products, mannitol, or sodium bicarbonate. Only specially formulated additives should be used with fat emulsions or amino-acid solutions (section 9.3).
3. Solutions should be thoroughly mixed by shaking and checked for absence of particulate matter before use.
4. Strict asepsis should be maintained throughout and in general the giving set should not be used for more than 24 hours (for drug admixtures).
5. The infusion container should be labelled with the patient’s name, the name and quantity of additives, and the date and time of addition (and the new expiry date or time). Such additional labelling should not interfere with information on the manufacturer’s label that is still valid. When possible, containers should be retained for a period after use in case they are needed for investigation.
6. It is good practice to examine intravenous infusions from time to time while they are running. If cloudiness, crystallisation, change of colour, or any other sign of interaction or contamination is observed the infusion should be discontinued.

Problems

Microbial contamination

The accidental entry and subsequent growth of micro-organisms converts the infusion fluid pathway into a potential vehicle for infection with micro-organisms, particularly species of Candida, Enterobacter, and Klebsiella. Ready-prepared infusions containing the additional drugs, or infusions prepared by an additive service (when available) should therefore be used in preference to making extemporaneous additions to infusion containers on wards etc.

Incompatibility

Physical and chemical incompatibilities may occur with loss of potency, increase in toxicity, or other adverse effect. The solutions may become opalescent or precipitation may occur, but in many instances there is no visual indication of incompatibility. Interaction may take place at any point in the infusion fluid pathway, and the potential for incompatibility is increased when more than one substance is added to the infusion fluid.

Common incompatibilities

Precipitation reactions are numerous and varied and may occur as a result of pH, concentration changes, ‘salting-out’ effects, complexation or other chemical changes. Precipitation or other particle formation must be avoided since, apart from lack of control of dosage on administration, it may initiate or exacerbate adverse effects. This is particularly important in the case of drugs which have been implicated in either thrombophlebitis (e.g. dexamethasone) or in skin sloughing or necrosis caused by extravasation (e.g. sodium bicarbonate and certain cytotoxic drugs). It is also especially important to effect solution of colloidal drugs and to prevent their subsequent precipitation in order to avoid a pyrogenic reaction (e.g. amphotericin).

It is considered undesirable to mix beta-lactam antibiotics, such as semi-synthetic penicillins and cephalosporins, with proteinaceous materials on the grounds that immunogenic and allergenic conjugates could be formed.

A number of preparations undergo significant loss of potency when added singly or in combination to large volume infusions. Examples include ampicillin in infusions that contain glucose or lactates. The breakdown products of dacarbazine have been implicated in adverse effects.

Blood

Because of the large number of incompatibilities, drugs should not normally be added to blood and blood products for infusion purposes. Examples of incompatibility with blood include hypertonic mannitol solutions (irreversible crenation of red cells), dextranast (rouleaux formation and interference with cross-matching), glucose (clumping of red cells), and oxytocin (inactivated).

If the giving set is not changed after the administration of blood, but used for other infusion fluids, a fibrin clot may form which, apart from blocking the set, increases the likelihood of microbial growth.

Intravenous fat emulsions

These may break down with coalescence of fat globules and separation of phases when additions such as antibacterials or electrolytes are made, thus increasing the possibility of embo-
lism. Only specially formulated products such as Viti-
pid N® (section 9.3) may be added to appropriate
intravenous fat emulsions.

**Other infusions** Infusions that frequently give rise to
incompatibility include amino acids, mannitol, and sodi-
um bicarbonate.

**Bactericides** Bactericides such as chlororesol 0.1% or
phenylmercuric nitrate 0.001% are present in some
injection solutions. The total volume of such solutions
added to a container for infusion on one occasion
should not exceed 15 mL.

---

**Method**

Ready-prepared infusions should be used whenever
available. **Potassium chloride** is usually available in
concentrations of 20, 27, and 40 mmol/litre in sodium
chloride intravenous infusion (0.9%), glucose intra-
venous infusion (5%) or sodium chloride and glucose
intravenous infusion. **Lidocaine hydrochloride** is
usually available in concentrations of 0.1 or 0.2% in
glucose intravenous infusion (5%).

When addition is required to be made extempora-
neously, any product reconstitution instructions such as
those relating to concentration, vehicle, mixing, and
handling precautions should be strictly followed using
an aseptic technique throughout. Once the product has
been reconstituted, addition to the infusion fluid should
be made immediately in order to minimise microbial
contamination and, with certain products, to prevent
degradation or other formulation change which may
occur; e.g. reconstituted ampicillin injection degrades
rapidly on standing, and also may form polymers which
could cause sensitivity reactions.

It is also important in certain instances that an infusion
fluid of specific pH be used (e.g. **furosemide** injection
requires dilution in infusions of pH greater than 5.5).

When drug additions are made it is important to mix
thoroughly; additions should not be made to an infusion
container that has been connected to a giving set, as
mixing is hampered. If the solutions are not thoroughly
mixed a concentrated layer of the additive may form
owing to differences in density. **Potassium chloride** is
particularly prone to this ‘layering’ effect when added
without adequate mixing to infusions packed in non-
rigid infusion containers; if such a mixture is adminis-
tered it may have a serious effect on the heart.

A time limit between addition and completion of admin-
istration must be imposed for certain admixtures to
guarantee satisfactory drug potency and compatibility.
For admixtures in which degradation occurs without the
formation of toxic substances, an acceptable limit is the
time taken for 10% decomposition of the drug. When
toxic substances are produced stricter limits may be
imposed. Because of the risk of microbial contamination
a maximum time limit of 24 hours may be appropriate
for additions made elsewhere than in hospital pharma-
cies offering central additive service.

Certain injections must be protected from light during
continuous infusion to minimise oxidation, e.g. amphot-
ericin, dacarbazine, and sodium nitroprusside.

Dilution with a small volume of an appropriate vehicle
and administration using a motorised infusion pump is
advocated for preparations such as unfractionated hepa-
tinic acid where strict control over administration is required.
In this case the appropriate dose may be dissolved in a
convenient volume (e.g. 24–48 mL) of sodium chloride
intravenous infusion (0.9%).

---

**Use of table**

The table lists preparations given by three methods:

- continuous infusion;
- intermittent infusion;
- addition via the drip tubing.

Drugs for **continuous infusion** must be diluted in a
large volume infusion. Penicillins and cephalosporins
are not usually given by continuous infusion because
of stability problems and because adequate plasma and
tissue concentrations are best obtained by intermittent
infusion. Where it is necessary to administer them by
continuous infusion, detailed literature should be con-
sulted.

Drugs that are both compatible and clinically suitable
may be given by **intermittent infusion** in a relatively
small volume of infusion over a short period of time, e.g.
100 mL in 30 minutes. The method is used if the product
is incompatible or unstable over the period necessary
for continuous infusion; the limited stability of ampicillin
or amoxicillin in large volume glucose or lactate infu-
sions may be overcome in this way.

Intermittent infusion is also used if adequate plasma and
tissue concentrations are not produced by continuous
infusion as in the case of drugs such as dacarbazine,
gentamicin, and ticarcillin.

An in-line burette may be used for intermittent infusion
techniques in order to achieve strict control over the
time and rate of administration, especially for infants
and children and in intensive care units. Intermittent
infusion may also make use of the ‘piggy-back’ techni-
que provided that no additions are made to the primary
infusion. In this method the drug is added to a small
secondary container connected to a Y-type injection site
on the primary infusion giving set; the secondary solu-
tion is usually infused within 30 minutes.

**Addition via the drip tubing** is indicated for a number
of cytotoxic drugs in order to minimise extravasation.
The preparation is added aseptically via the rubber
septum of the injection site of a fast-running infusion.
In general, drug preparations intended for a bolus effect
should be given directly into a separate vein where
possible. Failing this, administration may be made via
the drip tubing provided that the preparation is compa-
tible with the infusion fluid when given in this manner.

---

**Table of drugs given by intravenous infusion**

<table>
<thead>
<tr>
<th>Drug</th>
<th>Method of Administration</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Ampicillin</strong></td>
<td>Continuous infusion; intermittent infusion; addition via the drip tubing.</td>
</tr>
<tr>
<td><strong>Furosemide</strong></td>
<td>Continuous infusion; intermittent infusion; addition via the drip tubing.</td>
</tr>
<tr>
<td><strong>Potassium chloride</strong></td>
<td>Continuous infusion; intermittent infusion; addition via the drip tubing.</td>
</tr>
</tbody>
</table>

**Covers addition to** **Glucose intravenous infusion**, **0.9%**, **Sodium chloride intravenous infusion**, **0.9%**, **and Sodium chloride intravenous infusion**, **0.9%**. **Compatibility with glucose 5% and with sodium chloride 0.9% indicates compatibility with Sodium chloride and glucose intravenous infusion. Infusion of a large volume of hypotonic solution should be avoided therefore care should be taken if water for injections is used.** The information in the Table relates to the proprietary preparations indicated; for other preparations suitability should be checked with the manufacturer.
Appendix 6: Intravenous additives

Abatacept (Orencia®)
Intermittent in Sodium chloride 0.9%
Reconstitute each vial with 10 mL water for injections using the silicone-free syringe provided; dilute requisite dose in infusion fluid to 100 mL (using the same silicone-free syringe); give over 30 minutes through a low protein-binding filter (pore size 0.2 or 1.2 micron).

Abciximab (ReoPro®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute requisite dose in infusion fluid and give via infusion pump; filter upon dilution with infusion fluid through a non-pyrogenic low protein-binding 0.2, 0.22, or 5 micron filter or upon administration through an in-line non-pyrogenic low protein-binding 0.2 or 0.22 micron filter.

Acetylcysteine (Parvolex®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Glucose 5% is preferable—see Emergency Treatment of Poisoning.

Aciclovir (as sodium salt) (Zovirax IV; Aciclovir IV; Hospira; Aciclovir IV, Genus; Aciclovir Sodium, Zurich)
Intermittent in Sodium chloride 0.9% or Sodium chloride and glucose
For Zovirax IV®, Aciclovir IV (Genus) initially reconstitute to 25 mg/mL in water for injections or sodium chloride 0.9% then dilute to not more than 5 mg/mL with the infusion fluid; to be given over 1 hour; alternatively, may be administered in a concentration of 25 mg/mL using a suitable infusion pump and given over 1 hour; for Aciclovir IV (Hospira) dilute to not more than 5 mg/mL with infusion fluid; give over 1 hour.

Aciclovir IV (Genus)
Continuously administered in sodium chloride 0.9% or sodium chloride 0.9% at a concentration of 25 mg/mL in water for injections or sodium chloride 0.9%, to be given over 1 hour.

Agalsidase alfa (Replagal®)
Intermittent in Sodium chloride 0.9%
Dilute requisite dose with 100 mL infusion fluid and give over 40 minutes using an in-line filter; use within 3 hours of dilution.

Agalsidase beta (Fabrazyme®)
Intermittent in Sodium chloride 0.9%
Reconstitute with water for injections (35 mg in 7.2 mL, 5 mg in 1.1 mL) to produce a solution containing 5 mg/mL dilute with infusion fluid (for doses less than 35 mg dilute with at least 50 mL), doses 35–70 mg/dose with at least 100 mL doses 70–100 mg dilute with at least 250 mL; doses greater than 100 mg dilute with 500 mL and give through an in-line low protein-binding 0.2 micron filter at an initial rate of no more than 15 mg/hour; for subsequent infusions, infusion rate may be increased gradually once tolerance has been established.

Allantoin (as hydrochloride) (Rapifen®)
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%

Ampicillin sodium
Continuous in Glucose 5% or Sodium chloride 0.9%
Reconstitute each vial with 10 mL water for injections to produce a 5 mg/mL colloidal solution; dilute requisite dose with infusion fluid to a final concentration of 0.5–4 mg/mL, give through a low protein-binding in-line filter (0.2 micron) at an initial rate of 1 mg/kg/hour increased by 2 mg/kg/hour every 30 minutes to max. 7 mg/kg/hour.

Amifostine (Ethylol®)
Intermittent in Sodium chloride 0.9%
Reconstitute 500 mg vial with 9.7 mL sodium chloride 0.9% to produce a 50 mg/mL solution.

Amikacin sulphate (Amikin®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
To be given over 30 minutes.

Aminophylline
Continuous in Glucose 5% or Sodium chloride 0.9%

Amiodarone hydrochloride (Cordarone X®) Continuous or intermittent in Glucose 5%
Suggested initial infusion volume 250 mL given over 20–120 minutes; for repeat infusions up to 1.2 g in max. 500 mL, infusion in extreme emergency see section 2.7.3, should not be diluted to less than 600 micrograms/mL, incompatible with sodium chloride infusion; avoid equipment containing the plasticizer di-2-ethylhexylphthalate (DEHP).

Amoxicillin (as sodium salt) (Amoxi®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes via drip tubing in Glucose 5% or Sodium chloride 0.9%
Continuous infusion not usually recommended.

Amphotericin (lipid complex) (Abelcet®)
Intermittent in Glucose 5%
Allow suspension to reach room temperature, shake gently to ensure no yellow settlement, withdraw requisite dose (using 17–19 gauge needle) into one or more 20– mL syringes; replace needle on syringe with a 5-micron filter needle provided (fresh needle for each syringe) and dilute to a concentration of 1 mg/mL (2 mg/mL can be used in fluid restriction and in children), preferably give via an infusion pump at a rate of 2.5 mg/kg/hour (initial test dose of 1 mg given over 15 minutes), an in-line filter (pore size no less than 15 microns) may be used; do not use sodium chloride or other electrolyte solutions, flush existing intravenous line with glucose 5% or use separate line.

Amphotericin (liposomal) (AmBisome®)
Intermittent in Glucose 5% or 10%
Reconstitute each vial with 12 mL water for injections and shake vigorously to produce a preparation containing 4 mg/mL; withdraw requisite dose from vial and introduce into infusion fluid through the 5-micron filter provided to produce a final concentration of 0.2–2 mg/mL, infuse over 30–60 minutes, or if non-anaphylactic infusion-related reactions occur infuse over 2 hours (initial test dose 1 mg over 10 minutes), an in-line filter (pore size no less than 1 micron) may be used; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or 10%, or use separate line.

Amphotericin (as sodium deoxycholate complex) (Fungizone®)
Intermittent in Glucose 5%
Reconstitute each vial with 10 mL water for injections and shake immediately to produce a 5 mg/mL colloidal solution; dilute further in infusion fluid to a concentration of 100 micrograms/mL; pH of the glaucine must be not below 4.2 (check each container—consult product literature for details of buffer); infuse over 2–4 hours, or longer if not tolerated (initial test dose 1 mg over 20–30 minutes); begin infusion immediately after dilution and protect from light; compatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or use separate line; an in-line filter (pore size no less than 1 micron) may be used.

Anaphylactin (Penbritin®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes via drip tubing in Glucose 5% or Sodium chloride 0.9%
Continuous infusion not usually recommended.
Anidulafungin (Ecalta®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute each 100 mg with 30 mL water for injections, allow up to 5 minutes for reconstitution; dilute dose in infusion fluid to a concentration of 770 micrograms/mL, give at a rate not exceeding 1.1 mg/minute
Note Follow product information if using stock supplied with ethanol solvent

Antithymocyte immunoglobulin (Thymoglobulin®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Reconstitute each vial with 5 mL water for injections to produce a solution of 5 mg/mL; gently rotate to dissolve. Dilute requisite dose with infusion fluid to a total volume of 50–500 mL (usually 50 mL/vial), begin infusion immediately after dilution; give through an in-line filter (pore size 0.22 micron), not to be given with unfractionated heparin and hydrocortisone in glucose infusion as precipitation reported

Atefenol (Tenormin®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Suggested infusion time 20 minutes

Atosiban (Tractocile® concentrate for intravenous infusion)
Continuous in Glucose 5% or Sodium chloride 0.9%
Withdraw 10 mL infusion fluid from 100-mL bag and replace with 10 mL atosiban concentrate (7.5 mg/mL) to produce a final concentration of 750 micrograms/mL.

Atracurium besilate (Tracrium®; Atracurium besilate injection, Hospira; Atracurium injection/infusion, Genus)
Continuous in Glucose 5% or Sodium chloride 0.9%
Stability varies with diluent; dilute requisite dose with infusion fluid to a concentration of 0.5–5 mg/mL.

Azathioprine (as sodium salt) (Imuran®)
Intermittent in Sodium chloride 0.9% or Glucose 5%
Reconstitute 10 mL atosiban concentrate (7.5 mg/mL) to produce a final concentration as precipitation reported

Aztreonam (Azactam)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Suggested volume 100 mL given over 30–60 minutes

Calcitonin (salmon) (Miacalcic®)
Intermittent in Sodium chloride 0.9%
Diluted solution given without delay, dilute in 500 mL and give over at least 6 hours; glass or hard plastic containers should not be used; some loss of potency on dilution and administration

Calcium gluconate
Continuous in Glucose 5% or Sodium chloride 0.9%
Avoid bicarbonates, phosphates, or sulphates

Caspofungin (Cancidas®)
Intermittent in Sodium chloride 0.9%
Allow vial to reach room temperature; initially reconstitute each vial with 10.5 mL water for injections, mixing gently to dissolve, then dilute requisite dose in 250 mL infusion fluid (35–or 50-mg doses may be diluted in 100 mL infusion fluid if necessary); give over 60 minutes; incompatible with glucose solutions

Cefotaxime (as sodium salt)
Intermittent in Glucose 5% or Sodium chloride 0.9% or Water for injections
Suggested volume 40–100 mL given over 20–60 minutes; incompatible with alkaline solutions

Ceftazidime (as pentahydrate) (Fortum®, Kefadim®)
Intermittent or via drip tubing in Glucose 5% and 10% or Sodium chloride 0.9%
Dilute to a concentration of 50 mg in 50 mL with infusion fluid to a concentration of 1 mg/mL.

Ceftriaxone (as sodium salt) (Rocephin®; Ceftrixone Injection, Genus)
Intermittent or via drip tubing in Glucose 5% and 10% or Sodium chloride 0.9%
Reconstitute 2-g vial with 40 mL infusion fluid; give intermittent infusion over at least 20 minutes (60 minutes in neonates); not to be given simultaneously with total parenteral nutrition or infusion fluids containing calcium, even by different infusion lines; may be infused sequentially with infusion fluids containing calcium if flush with sodium chloride 0.9% between infusions or give infusions by different infusion lines at different sites

Cefuroxime (as sodium salt) (Zinacef®)
Intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%
Dilute initially in water for injections (at least 2 mL) then dilute to a concentration of less than 20 mg/mL; to be given over 20–60 minutes

Chloramphenicol (as sodium succinate)
Kemicetine®
Intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%
Dilute initially in water for injections (at least 2 mL) then dilute to a concentration of less than 20 mg/mL; to be given over 20–60 minutes (60 minutes in neonates); not to be used with PVC equipment

Clindamycin (as hydrochloride) (Cleocin®)
Intermittent or continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of 30 mg in 20–100 mL; give intermittent infusion over 2–6 hours; not to be used with PVC equipment

Cidofovir (Vistide®)
Intermittent in Sodium chloride 0.9%
Dilute requisite dose with 100 mL infusion fluid; infuse over 1 hour

Cisatracurium (Nimbex®, Nimbex Forte®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Solutions of 2 mg/mL and 5 mg/mL may be infused undiluted; alternatively dilute with infusion fluid to a concentration of 0.1–2 mg/mL.
Appendix 6: Intravenous additives

**Clarithromycin** *(Klaricid® I.V.)*

- Intermittent in Glucose 5% or Sodium chloride 0.9%
- Dissolve initially in water for injections (500 mg in 10 mL) then dilute to a concentration of 2 mg/mL, give over 60 minutes

**Clindamycin (as phosphate)** *(Dalacin® C Phosphate)*

- Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
- Dilute to not more than 18 mg/mL and give over 10–60 minutes at a rate not exceeding 30 mg/minute (1.5 g over at least 60 minutes; higher doses by continuous infusion)

**Clonazepam** *(Rivotril®)*

- Intermittent in Glucose 5% and 10% or Sodium chloride 0.9%
- Suggested volume 250 mL

**Co-amoxiclav** *(Augmentin®)*

- Intermittent in Sodium chloride 0.9% or Water for injections
- Reconstitute 600 mg initially with 10 mL water for injections, then dilute with 50 mL infusion fluid; reconstitute 1.2 g initially with 20 mL water for injections, then dilute with 100 mL infusion fluid; give over 30–40 minutes

**Co-fluampicil (as sodium salts)** *(Magnapen®)*

- Intermittent in Glucose 5% or Sodium chloride 0.9%
- Reconstituted solutions diluted and given without delay; suggested volume 100 mL, given over 30–60 minutes

**Co-amoxiclav (Augmentin®)*

- Intermittent in Sodium chloride 0.9% or Water for injections
- Reconstitute 500 mg with 25 mL sodium chloride 0.9%; reconstitute 1 g with 50 mL sodium chloride 0.9%; reconstitute 2 g with 100 mL sodium chloride 0.9%

**Colistimethate sodium** *(Colymycin®)*

- Intermittent in Sodium chloride 0.9% or Water for injections
- Dilute with 50 mL infusion fluid and give over 30 minutes

**Co-trimoxazole** *(Septin® for infusion)*

- Intermittent in Glucose 5% and 10% or Sodium chloride 0.9%
- Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL, suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and infused over more than 60 minutes

**Cyclophosphamide** *(Cyclophosphamide injection, Baxter)*

- via drip tubing in Glucose 5% or Sodium chloride 0.9%
- Reconstitute 500 mg with 25 mL sodium chloride 0.9%; reconstitute 1 g with 50 mL sodium chloride 0.9%

**Danaparoid sodium** *(Orgaran®)*

- Continuous in Glucose 5% or Sodium chloride 0.9%

**Daptomycin** *(Cubicin®)*

- Intermittent in Sodium chloride 0.9%
- Reconstitute with sodium chloride 0.9% (350 mg in 7 mL, 500 mg in 10 mL); gently rotate vial without shaking; allow to stand for at least 10 minutes then rotate gently to dissolve; dilute requisite dose in 50 mL infusion fluid and give over 30 minutes

**Desferrioxamine mesilate** *(Desfera®)*

- Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
- Reconstitute with water for injections to a concentration of 100 mg/mL; dilute with infusion fluid

**Desmopressin** *(DDAVP®, Octin®)*

- Intermittent in Sodium chloride 0.9%
- Dilute with 50 mL and give over 20 minutes

**Dexamethasone sodium phosphate** *(Decadron®, Hospira; Dexamethasone, Organon)*

- Continuous or intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%

**Dexrazoxane** *(Cardioxane®)*

- Intermittent in Compound sodium lactate
- Reconstitute each vial with 25 mL water for injections and dilute each vial with 25–100 mL infusion fluid; give requisite dose over 15 minutes

**Diazepam (solution)** *(Diazepam, Wockhardt)*

- Continuous in Glucose 5% or Sodium chloride 0.9%
- Glucose is preferred as infusion fluid

**Diazepam (emulsion)** *(Diazemuls®)*

- Continuous in Glucose 5 and 10%
- May be diluted to a max. concentration of 200 mg in 500 mL, max. 6 hours between addition and completion of administration; adsorbed to some extent by the plastics of bags and infusion sets

**Diclofenac sodium** *(Voltarol®)*

- Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
- Dilute 75 mg with 100–500 mL infusion fluid (previously buffered with 0.5 mL sodium bicarbonate 8.4% solution or with 1 mL sodium bicarbonate 4.2% solution); for intermittent infusion give 25–50 mg over 15–60 minutes or 75 mg over 30–120 minutes; for continuous infusion give at a rate of 5 mg/hour

**Digoxin** *(Lanoxin®)*

- Intermittent in Glucose 5% or Sodium chloride 0.9%
- Dilute to a concentration of not more than 62.5 micrograms/mL. To be given over at least 2 hours

**Digoxin-specific antibody fragments** *(Digibind®)*

- Intermittent in Sodium chloride 0.9%
- Dissolve initially in water for injections (4 mL/vial) then dilute with the sodium chloride 0.9% and give through a 0.22 micron sterile, disposable filter over 30 minutes

**Dinoprostone** *(Prostin E2®)*

- Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%

**Disodium pamidronate** *(Aredia®, Disodium pamidronate, Britannia, Hospira, Medac)*

- Intermittent in Glucose 5% or Sodium chloride 0.9%
- For Aredia® and Pamidronate disodium (Britannia), reconstitute initially with water for injections (15 mg in 5 mL, 30 mg or 90 mg in 10 mL) for Aredia®. Pamidronate disodium (Britannia), Disodium pamidronate (Hospira), dilute with infusion fluid to a concentration of not more than 60 mg in 250 mL; for Dinoprostone pamidronate (Medac) dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL, give at a rate not exceeding 1 mg/minute, not to be given with infusion fluids containing calcium
Disopyramide (as phosphate) *(Rythmodan®)*
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
Max. rate by continuous infusion 20–30 mg/hour (or 400 micrograms/kg/hour)

Dobutamine (as hydrochloride)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of 0.5–1 mg/mL and give via a controlled infusion device; give higher concentration (max. 5 mg/mL) with infusion pump; incompatible with bicarbonate

Dopamine hydrochloride
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to max. concentration of 3.2 mg/mL, incompatible with bicarbonate

Dopexamine hydrochloride *(Dopacard®)*
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of 400 or 800 micrograms/mL, max. concentration via large peripheral vein 1 mg/mL, concentrations up to 4 mg/mL may be infused via central vein; give via infusion pump or other device which provides accurate control of rate; contact with metal should be minimised; incompatible with bicarbonate

Ertapenem *(Invanz®)*
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute 500 mg with 10 mL water for injections or sodium chloride 0.9%; dilute requisite dose in infusion fluid to a final concentration of 0.25 mg/mL; maximum concentration 5 mg/mL; continuous infusion not usually recommended

Ertapenem *(Nexium®)*
Intermittent in Sodium chloride 0.9%
Reconstitute 1 g with 10 mL water for injections or sodium chloride 0.9%; dilute requisite dose in infusion fluid to a final concentration not exceeding 20 mg/mL; give over 30 minutes; incompatible with glucose solutions

Erythromycin (as lactobionate)
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
Dissolve initially in water for injections (1 g in 20 mL) then dilute to a concentration of 1 mg/mL for continuous infusion and 1–5 mg/mL for intermittent infusion; give intermittent infusion over 20–60 minutes

Esomeprazole (as sodium salt) *(Nexium®)*
Continuous or intermittent in Sodium chloride 0.9%
Reconstitute 40–80 mg with up to 100 mL infusion fluid; for intermittent infusion, give requisite dose over 10–30 minutes; stable for 12 hours in sodium chloride 0.9%

Esomeprazole (as sodium salt)
Continuous or intermittent in Sodium chloride 0.9%
Dilute to a concentration of 5–10%

Fentanyl *(Sublimaze®)*
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%

Ferric carboxymaltose *(Ferinject®)*
Intermittent in Sodium chloride 0.9%
Dilute 200–500 mg in up to 100 mL infusion fluid and give over at least 6 minutes; dilute 0.5–1 g in up to 250 mL infusion fluid and give over at least 15 minutes

Flecainide acetae *(Tamibor®)*
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
Minimum volume in infusion fluids containing chlorides 500 mL

Fonapidarinux *(Arixtra®)*
Intermittent in Sodium chloride 0.9%
For ST-segment elevation myocardial infarction, add requisite dose to 25–50 mL infusion fluid and give over 1–2 minutes

Fosaprepitant *(Ivenem®)*
Intermittent in Sodium chloride 0.9%
Reconstitute each 115-mg vial with 5 mL sodium chloride 0.9% gently without shaking to avoid foaming, then dilute in 110 mL infusion fluid; give over 15 minutes

Foscarnet sodium *(Foscavir®)*
Intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of 1.5–25 mg/L (phenytoin sodium equivalent)/mL

Furosemide (as sodium salt) *(Lasix®)*
Continuous in Sodium chloride 0.9%
Infusion pH must be above 5.5 and rate should not exceed 4 mg/min; glucose solutions are unsuitable

Fusidic acid (as sodium salt)
Continuous in Sodium chloride 0.9%
Reconstitute with the buffer solution provided and dilute to 500 mL; give through central venous line over 2 hours (or over 6 hours if superficial vein used); incompatible in solution of pH less than 7.4

Ethanol
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of 5–10%

Fusidic acid (as sodium salt)
Continuous in Sodium chloride 0.9%
Reconstitute in water for injections (1 g in 20 mL) then dilute to a concentration of 5 mg/mL for infusion; give intermittent infusion over 20–60 minutes

Glycine buffer diluent only, for pump or other device which provides accurate control of rate; continuous or intermittent in Glucose 5% or Sodium chloride 0.9%; dilute requisite dose in infusion fluid to a final concentration of 0.25 mg/mL; compatible with glucose solutions; use only plastic containers or syringes

Glycolate buffer diluent only, for pump or other device which provides accurate control of rate; continuous or intermittent in Glucose 5% or Sodium chloride 0.9%; dilute requisite dose in infusion fluid to a final concentration of 0.5 mg/mL; compatible with glucose solutions; use only plastic containers or syringes

Glucose 5% *(neutralised by bicarbonate)*
Continuous or intermittent infusion, give requisite dose over 1 hour (for severe hospital-acquired pneumonia or hospital-acquired pneumonia caused by less sensitive organisms, may extend infusion time to 4 hours using sodium chloride 0.9% as the infusion fluid)

Glucose 5% *(but see below)*
Continuous or intermittent infusion, give requisite dose over 1 hour (infusion-related reactions occur)

Glucose 5%
Suggested volume 100 mL given over 30–60 minutes via drip tubing in Glucose 5% or Sodium chloride 0.9%
Continuous infusion not usually recommended

Flumazenil *(Anexate®)*
Continuous in Glucose 5% or Sodium chloride 0.9%

Fondaparinux *(Arixtra®)*
Intermittent in Sodium chloride 0.9%
For ST-segment elevation myocardial infarction, add requisite dose to 25–50 mL infusion fluid and give over 1–2 minutes

Fosaprepitant *(Ivenem®)*
Intermittent in Sodium chloride 0.9%
Reconstitute each 115-mg vial with 5 mL sodium chloride 0.9% gently without shaking to avoid foaming, then dilute in 110 mL infusion fluid; give over 15 minutes

Foscarnet sodium *(Foscavir®)*
Intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of 1.5–25 mg/L (phenytoin sodium equivalent)/mL
Appendix 6: Intravenous additives

**Galsulfase (Naglazyme™)**
Intermittent in Sodium chloride 0.9%
Dilute requisite dose with infusion fluid to final volume of 250 mL and mix gently; infuse through a 0.2 micron in-line filter; give approx. 2.5% of the total volume over 1 hour; then infuse remaining volume over next 3 hours; if body-weight under 20 kg and at risk of fluid overload, dilute requisite dose in 100 mL infusion fluid and give over at least 4 hours

**Ibandronic acid (Bonolonat™)**
Intermittent in Sodium 5% or Sodium chloride 0.9%
Dilute requisite dose in 500 mL infusion fluid and give over 1–2 hours

**Idursulfase (Elaprase™)**
Intermittent in Sodium chloride 0.9%
Dilute requisite dose in 100 mL infusion fluid and mix gently (do not shake); give over 3 hours (gradually reduced to 1 hour if no infusion-related reactions)

**Imiglucerase (Cerezyme™)**
Intermittent in Sodium chloride 0.9%
Initially reconstitute with water for injections (200 units in 5 mL, 400 units in 10 mL) to give 40 units/mL solution; dilute requisite dose with infusion fluid to the final volume of 100–200 mL and give initial dose at a rate not exceeding 0.5 units/kg/minute; subsequent doses to be given at a rate not exceeding 1 unit/kg/minute; administer within 3 hours after reconstitution

**Imipenem with clastatin (as sodium salt) (Primaxin)**
Intermittent in Sodium chloride 0.9% or Sodium chloride and Glucose
Dilute to a concentration of 5 mg (as imipenem)/mL; infuse 250–500 mg (as imipenem) over 20–30 minutes, 1 g over 60 minutes
Continuous infusion not usually recommended

**Infliximab (Remicade™)**
Intermittent in Sodium chloride 0.9%
Reconstitute each 100-mg vial with 10 mL water for injections using a 21-gauge or smaller needle; gently swirl vial without shaking to dissolve; allow to stand for 5 minutes; dilute requisite dose with infusion fluid to a final volume of 250 mL and give through a low protein-binding filter (1.2 micron or less); over at least 2 hours (patients being treated for rheumatoid arthritis who have tolerated 3 initial 2-hour infusions may be given subsequent infusions of up to 6 mg/kg over at least 1 hour); start infusion within 3 hours of reconstitution

**Insulin (soluble)**
Continuous in Sodium chloride 0.9%
Adsorbed to some extent by plastics of infusion set; see also section 6.1.3; ensure insulin is not injected into ‘dead space’ of injection port of the infusion bag

**Insulin aspart**
Continuous in Sodium chloride 0.9% or Glucose 5%
Dilute to 0.05–1 unit/mL with infusion fluid; adsorbed to some extent by plastics of infusion set

**Insulin glulisine (Apidra™)**
Continuous in Sodium chloride 0.9%
Dilute to 1 unit/mL with infusion fluid; use a co-extruded polyolefin/polyamide plastic infusion bag with a dedicated infusion line

**Insulin lispro**
Continuous in Sodium chloride 0.9% or Glucose 5%
Adsorbed to some extent by plastics of infusion set

**Iron dextran (Cosmofer™)**
Intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute 100–200 mg in 100 mL infusion fluid; give 25 mg over 15 minutes as a test dose initially, then give at a rate not exceeding 6.67 mg/minute; total dose to be administered in 500 mL infusion fluid and given over 4–6 hours (initial test dose 25 mg over 15 minutes)

**Iron isomaltoside 1000 (Monofer™)**
Intermittent in Sodium chloride 0.9%
For details consult product literature

**Iron sucrose (Venofer™)**
Intermittent in Sodium chloride 0.9%
Dilute 100 mg in up to 100 mL infusion fluid; give 25 mg over 15 minutes as a test dose initially, then give at a rate not exceeding 3.33 mg/minute
**Appendix 6: Intravenous additives**

**Isosorbide dinitrate** *(Isoket 0.05%, Isoket 0.1%)*
Continuous in Glucose 5% or Sodium chloride 0.9%
AdSORBED to some extent by polyvinyl chloride infusion containers; preferably use glass or polyethylene containers or give via a syringe pump. *Isoket 0.05%* can alternatively be administered undiluted using a syringe pump with a glass or rigid plastic syringe.

**Itraconazole** *(Sporanox®)*
- Intermittent in Sodium chloride 0.9%
  - Dilute 200 mg in 50 mL infusion fluid and infuse only 60 mL through an in-line filter (0.2 micron) over 60 minutes
- **Ketamine (as hydrochloride)** *(Ketalar®)*
  - Continuous
  - In syringe pump;
  - Infusion rate should be given over at least 5 minutes, high doses over at least 15 minutes

**Labetalol hydrochloride** *(Trandate®)*
- Intermittent in Glucose 5% or Sodium chloride 0.9%
  - Dilute to a concentration of 1 mg/mL; suggested volume 200 mL; adjust rate with in-line burette

**Lacosamide** *(Vimpat®)*
- Intermittent in Glucose 5% or Sodium chloride 0.9%
  - May be administered undiluted

**Laronidase** *(Aladurzyme®)*
- Intermittent in Sodium chloride 0.9%
  - Body-weight under 20 kg, use 100 mL infusion fluid; body-weight over 20 kg use 250 mL infusion fluid; withdraw volume of infusion fluid equivalent to volume of laronidase concentrate being added; give through an in-line filter (0.22 micron) at an initial rate of 2 units/kg/hour then increasing gradually every 15 minutes to max. 43 units/kg/hour

**Lenograstim** *(Granocyte®)*
- Intermittent in Sodium chloride 0.9%
  - Initially reconstitute with 1 mL water for injection provided (do not shake vigorously) then dilute with at least 50 mL infusion fluid; protect infusion from light; give over 60 minutes

**Lepirudin** *(Refludan®)*
- Continuous in Glucose 5% or Sodium chloride 0.9%
  - Reconstitute initially with water for injections or sodium chloride 0.9% then dilute to a concentration of 2 mg/mL with infusion fluid

**Levetiracetam** *(Keppra®)*
- Intermittent in Glucose 5% or Sodium chloride 0.9%
  - Dilute requisite dose with at least 100 mL of infusion fluid; give over 15 minutes

**Magnesium sulphate**
Continuous in Glucose 5% or Sodium chloride 0.9%
Suggested concentration up to 200 mg/mL, max. rate 150 mg/minute

**Mepolizumab** *(Mepem®)*
- Intermittent in Sodium chloride 0.9%
  - Dilute dose in infusion fluid to a final concentration of 1–20 mg/mL; give over 15–30 minutes

**Methyldopa** *(as hydrochloride)** *(Lidoderm®)*
Continuous or intermittent via drip tubing in Glucose 5% or Sodium chloride 0.9%
Suggested volume 500 mL

**Methyldopamine hydrochloride** *(Maxolon High Dose®)*
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
Continuous infusion recommended; loading dose, dilute with 50–100 mL and give over 15–20 minutes; maintenance dose, dilute with 500 mL and give over 6–12 hours; for intermittent infusion dilute with at least 50 mL and give over at least 15 minutes

**Mivacurium** *(as chloride)*
Continuous in Glucose 5% or Sodium chloride 0.9%
Continuous infusion 1 mg/mL; microdrip infusion for maintenance of muscle relaxation

**Naloxone** *(Ninjax®, Naloxone Hydrochloride)*
Continuous in Glucose 5%
- Dilute to a concentration of 200 micrograms/mL and administer via an infusion pump, see “Emergency Treatment of Poisoning with Opioids”

**Natalizumab** *(Tysabri®)*
- Intermittent in Sodium chloride 0.9%
  - Dilute 300 mg in 100 mL infusion fluid, gently invert to mix, do not shake. Use within 8 hours of dilution and give over 1 hour

**Nimodipine** *(Nimotop®)*
via drip tubing in Glucose 5% or Sodium chloride 0.9%
- Not to be added to infusion container; administer via an infusion pump through a Y-piece into a central catheter; incompatible with polyvinyl chloride giving sets or containers; protect infusion from light

**Nizatidine** *(Axid®)*
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
For continuous infusion, dilute 300 mg in 150 mL and give at a rate of 10 mg/hour; for intermittent infusion, dilute 100 mg in 50 mL and give over 15 minutes

**Noradrenaline acid tartrate/Norepinephrine bitartrate**
Continuous in Glucose 5% or Sodium chloride 0.9%
Give via controlled infusion device; for administration via syringe pump, dilute 4 mg noradrenaline acid tartrate (2 mL solution) with 48 mL, for administration via drip counter dilute 40 mg (20 mL solution) with 480 mL, give through a central venous catheter, incompatible with alkalai.

**Omeprazole** *(as sodium salt)* *(Losec®)*
Intermittent or continuous in Glucose 5% or Sodium chloride 0.9%
Reconstitute each 40 mg vial with infusion fluid and dilute to 100 mL; for intermittent infusion, give 40 mg over 20–30 minutes; stable for 3 hours in glucose 5% or 12 hours in sodium chloride 0.9%

**Metoclopramide hydrochloride** *(CellCept®)*
Continuous in Glucose 5% or Sodium chloride 0.9%
Continuous infusion recommended; loading dose, dilute with 50–100 mL and give over 15–20 minutes; maintenance dose, dilute with 500 mL and give over 6–12 hours; for intermittent infusion dilute with at least 50 mL and give over at least 15 minutes

**Micafungin** *(Mycamine®)*
- Intermittent in Glucose 5% or Sodium chloride 0.9%
  - Reconstitute each vial with 5 mL infusion fluid, gently rotate vial, without shaking, to dissolve, dilute requisite dose with infusion fluid to 100 mL (final concentration 0.5–2 mg/mL); protect infusion from light; give over 60 minutes

**Midazolam** *(Hypnovel®)*
Continuous in Glucose 5% or Sodium chloride 0.9%
For neonates and children under 15 kg dilute to a max. concentration of 1 mg/mL

**Mirtolone** *(Primacor®)*
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a suggested concentration of 200 micrograms/mL

**Mivacurium** *(as chloride)** *(Mivacron®)*
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of 500 micrograms/mL, may also be given undiluted

**Mycopelate mofetil** *(as hydrochloride)** *(CellCept®)*
- Intermittent in Glucose 5%
  - Reconstitute each 500-mg vial with 14 mL glucose 5% and dilute the contents of 2 vials in 140 mL infusion fluid, give over 2 hours

**Pentamidine** *(as isethionate)* *(Miniset®)*
Continuous in Glucose 5%
- Dilute to a concentration of 200 micrograms/mL and administer via an infusion pump, see “Emergency Treatment of Poisoning with Opioids”

**Pentazocine** *(Tylazin®)*
- Intermittent in Sodium chloride 0.9%
  - Dilute 300 mg in 100 mL infusion fluid, gently invert to mix, do not shake. Use within 8 hours of dilution and give over 1 hour

**Pentazocine (as isethionate)** *(Tylazin®)*
Continuous in Glucose 5%
- Dilute to a concentration of 200 micrograms/mL and administer via an infusion pump, see “Emergency Treatment of Poisoning with Opioids”

**Primidone** *(Mysoline®)*
Continuous in Glucose 5%
- Dilute to a concentration of 200 micrograms/mL and administer via an infusion pump, see “Emergency Treatment of Poisoning with Opioids”

**Procarbazine** *(CellCept®)*
- Continuous in Sodium chloride 0.9%
  - Dilute 300 mg in 50 mL infusion fluid, gently invert to mix, do not shake. Use within 8 hours of dilution and give over 1 hour

**Prochlorperazine** *(as hydrochloride)* *(Compazine®)*
Continuous in Glucose 5%
- Dilute to a concentration of 200 micrograms/mL and administer via an infusion pump, see “Emergency Treatment of Poisoning with Opioids”

**Promethazine** *(Phenergan®)*
Continuous in Glucose 5%
- Dilute to a concentration of 200 micrograms/mL and administer via an infusion pump, see “Emergency Treatment of Poisoning with Opioids”

**Propofol** *(Diprivan®)*
Continuous in Glucose 5%
- Dilute to a concentration of 200 micrograms/mL and administer via an infusion pump, see “Emergency Treatment of Poisoning with Opioids”

**Promethazine** *(as hydrochloride)* *(Phenergan®)*
Continuous in Glucose 5%
- Dilute to a concentration of 200 micrograms/mL and administer via an infusion pump, see “Emergency Treatment of Poisoning with Opioids”

**Promethazine** *(as hydrochloride)* *(Phenergan®)*
Continuous in Glucose 5%
- Dilute to a concentration of 200 micrograms/mL and administer via an infusion pump, see “Emergency Treatment of Poisoning with Opioids”
Appendix 6: Intravenous additives

Ondansetron (as hydrochloride) (Zofran®)
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
For intermittent infusion, dilute 32 mg in 50–100 mL and give over at least 15 minutes

Oxydode hydrochloride (OxyNorm®)
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of 1 mg/mL.

Phytomenadione (in mixed micelles vehicle)

Phenytoin sodium

Phenylephrine hydrochloride

Phenoxybenzamine hydrochloride

Pentamidine isetionate

Pantoprazole (as sodium sesquihydrate) (Protium®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute 40 mg with 10 mL, 4.5 g in 20 mL; give over at least 15 minutes

Potassium chloride
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute in a large-volume infusion, mix thoroughly to avoid ‘layering’, especially in non-rigid infusion containers; use ready-prepared solutions when possible

Propofol (emulsion) (Diprivan®; Abbott; Propofol-Lipuro®, Propofen®, Braun; Hospira; Fresenius Kabi)
0.5%, 1%, or 2% emulsion
via drip tubing in Glucose 5% or Sodium chloride 0.9%
To be administered via a Y-piece close to injection site; microbiological filter not recommended

1% emulsion only
Continuous in Glucose 5% or Sodium chloride 0.9%
for Propofol-Lipuro®, Propofen®, Braun, and Fresenius Kabi brands only)
Dilute to a concentration not less than 2 mg/mL; microbiological filter not recommended; administer using suitable device to control infusion rate; use glass or PVC containers (if PVC bag used it should be full—withdraw volume of infusion fluid equal to that of propofol to be added); give within 6 hours of preparation, propofol may alternatively be infused undiluted using a suitable control infusion pump

Quinine dihydrochloride
Continuous in Glucose 5% or Sodium chloride 0.9%
To be given over 4 hours; see also section 5.4.1

Ranitidine (as hydrochloride) (Zantac®)
Intermittent in Glucose 5% or Sodium chloride 0.9%

Rasburicase (Fasturtex®)
Intermittent in Sodium chloride 0.9%
Reconstitute with solvent provided; gently swirl vial without shaking to dissolve; dilute requisite dose to 50 mL with infusion fluid and give over 30 minutes

Remifentanil (Ultiva®)
Continuous in Glucose 5% or Sodium chloride 0.9%
or Water for injections
Reconstitute with infusion fluid to a concentration of 1 mg/mL
then dilute further to a concentration of 20–250 micrograms/mL
50 micrograms/mL recommended for general anaesthesia, 20–25 micrograms/mL recommended for children 1–12 years, 20–50 micrograms/mL recommended when used with target controlled infusion (TCI) device

Rifampicin (Rifadin®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute with solvent provided then dilute with 500 mL infusion fluid; give over 2–3 hours

Ritodrine hydrochloride (Yutopar®)
Continuous in Glucose 5%
Give via controlled infusion device, preferably a syringe pump; if syringe pump available dilute to a concentration of 3 mg/mL if syringe pump not available dilute to a concentration of 300 micrograms/mL; close attention to patient’s fluid and electrolyte status essential

Rituximab (MabThera®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute to 1–4 mg/mL and gently invert bag to avoid foaming

Rocuronium bromide (Esmeron®)
Continuous or via drip tubing in Glucose 5% or Sodium chloride 0.9%

900 Appendix 6: Intravenous additives
Salbutamol (as sulphate) (Ventolin® For Intravenous Infusion)
Continuous in Glucose 5%
For bronchodilatation dilute to a concentration of 200 micrograms/mL with glucose 5% or sodium chloride 0.9%; for premature labour dilute with glucose 5% to a concentration of 100 micrograms/mL for use in a syringe pump or for other infusion methods (preferably via controlled infusion device), dilute to a concentration of 20 micrograms/mL; close attention to patient’s fluid and electrolyte status essential

Sodium calcium edetate (Ledclair®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of not more than 3%; suggested volume 250–500 mL given over at least 1 hour

Sodium nitroprusside
Continuous in Glucose 5%
Infuse via infusion device to allow precise control; protect infusion from light. For further details consult product literature

Sodium valproate
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute Epilim® with solvent provided then dilute with infusion fluid

Streptokinase (Streptase®)
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute with sodium chloride 0.9%, then dilute further with infusion fluid

Tacrolimus (Prograf®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute concentrate in infusion fluid to a final concentration of 4–100 micrograms/mL; give over 24 hours; incompatible with PVC

Telcoplan (Targocid®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute initially with water for injections provided; infuse over 30 minutes
Continuous infusion not usually recommended

Temocillin (Negaban®)
Intermittent in Glucose 5% or 10% or Sodium chloride 0.9%
Reconstitute 1 g with 10 mL water for injections then dilute with 50–150 mL infusion fluid, give over 30–60 minutes

Terbutaline sulphate (Bricanyl®)
Continuous in Glucose 5%
For bronchodilatation dilute 1.5–2.5 mg with 500 mL glucose 5% or sodium chloride 0.9% and give over 6–10 hours; for premature labour dilute in glucose 5% and give via controlled infusion device preferably a syringe pump; if syringe pump available dilute to a concentration of 100 micrograms/mL; if syringe pump not available dilute to a concentration of 10 micrograms/mL; close attention to patient’s fluid and electrolyte status essential

Ticarcillin sodium with clavulanic acid (Timentin®)
Intermittent in Glucose 5% or Water for injections
Suggested volume (depending on dose) glucose 5% 100–150 mL or water for injections 50–100 mL, given over 30–40 minutes

Tigecycline (Tigecycline)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute each vial with 5.3 mL infusion fluid to produce a 10 mg/mL solution; dilute requisite dose in 100 mL infusion fluid; give over 30–60 minutes

Tirofiban (Aggrastat®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Withdraw 50 mL infusion fluid from 250-mL bag and replace with 50 mL tirofiban concentrate (250 micrograms/mL) to give a final concentration of 58 micrograms/mL

Appendix 6: Intravenous additives

Tobramycin (as sulphate) (Nebcin®)
Intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%
For adult intermittent infusion suggested volume 50–100 mL (children proportionately smaller volume) given over 20–60 minutes

Tocilizumab (RoActemra®)
Intermittent in Sodium chloride 0.9%
Dilute requisite dose to a volume of 100 mL with infusion fluid and give over 1 hour

Tramadol hydrochloride (Zydone®)
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%

Tranexamic acid (Cyklokapron®)
Continuous in Glucose 5% or Sodium chloride 0.9%

Urokinase (Syner-KINASE®)
Continuous or intermittent in Sodium chloride 0.9%

Vancomycin (as hydrochloride) (Vancocin®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute each 500 mg with 10 mL water for injections and dilute with infusion fluid to a concentration of up to 5 mg/mL (10 mg/mL in fluid restriction but increased risk of infusion-related effects); give over at least 60 minutes (rate not to exceed 10 mg/minute for doses over 500 mg); use continuous infusion only if intermittent not feasible

Vasopressin, synthetic (Pitressin®)
Intermittent in Glucose 5%
Suggested concentration 20 units/100 mL given over 15 minutes

Vecuronium bromide (Norcuron®)
Continuous or via drip tubing in Glucose 5% or Sodium chloride 0.9%
Reconstitute each vial with 5 mL water for injections to give 2 mg/mL solution, alternatively reconstitute with up to 10 mL glucose 5% or sodium chloride 0.9% or water for injections—unsuitable for further dilution if not reconstituted with water for injections. For continuous intravenous infusion, dilute to a concentration up to 40 micrograms/mL

Velaglucerase alfa (VPRIV®)
Intermittent in Sodium chloride 0.9%
Reconstitute each 400–unit vial with 4.3 mL water for injections to produce a 100 units/mL solution; dilute requisite dose in 100 mL infusion fluid, give over 60 minutes through a 0.22 micron filter, start infusion within 24 hours of reconstitution

Verteporfin (Visudyne®)
Intermittent in Glucose 5%
Reconstitute each 15 mg with 7 mL water for injections to produce a 2 mg/mL solution then dilute requisite dose with infusion fluid to a final volume of 30 mL and give over 10 minutes; protect infusion from light and administer within 4 hours of reconstitution. Incompatible with sodium chloride infusion

Vitamins B & C (Pabrinex® 1/IV High potency)
Intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%
Ampluole contents should be mixed, diluted, and administered without delay; give over 30 minutes (see MHRA/CHM advice, section 9.6.2)

Vitamins, multiple
(Cernevit®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Suggested concentration 20 units/100 mL given over 15 minutes

Appendix 6: Intravenous additives 901
Voriconazole ([Vfend®])
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute each 200 mg with 19 mL water for injections to produce a 10 mg/mL solution; dilute dose in infusion fluid to concentration of 0.5–5 mg/mL, give at a rate not exceeding 3 mg/kg/hour.

Zidovudine ([Retrovir®])
Intermittent in Glucose 5%
Dilute to a concentration of 2 mg/mL or 4 mg/mL and give over 1 hour.

Zoledronic acid ([Zometa®])
Intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute requisite dose with 100 mL infusion fluid, infuse over at least 15 minutes; administer as a single intravenous solution in a separate infusion line; do not mix with calcium or other divalent cation-containing infusion solutions such as lactated Ringer’s solution.
A7 Borderline substances

A7.1 Enteral feeds (non-disease specific) 904
A7.1.1 Enteral feeds (non-disease specific): less than 5 g protein/100 mL 904
A7.1.2 Enteral feeds (non-disease specific): 5 g (or more) protein/100 mL 906
A7.1.3 Enteral feeds (non-disease specific): Child under 12 years 910
A7.2 Nutritional supplements (non-disease specific) 910
A7.2.1 Nutritional supplements: less than 5 g protein/100 mL 910
A7.2.2 Nutritional supplements: 5 g (or more) protein/100 mL 911
A7.3 Specialised formulas 915
A7.3.1 Specialised formulas: Infant and child 916
A7.3.2 Specialised formulas for specific clinical conditions 916
A7.4 Feed supplements 919
A7.4.1 High-energy supplements 919
A7.4.2 Fibre, vitamin, and mineral supplements 924
A7.5 Feed additives 925
A7.5.1 Special additives for conditions of intolerance 925
A7.5.2 Feed thickeners and pre-thickened drinks 925
A7.5.3 Flavouring preparations 925
A7.6 Foods for special diets 925
A7.6.1 Gluten-free foods 925
A7.6.2 Low-protein foods 928
A7.7 Nutritional supplements for metabolic diseases 929

In certain conditions some foods (and toilet preparations) have characteristics of drugs and the Advisory Committee on Borderline Substances (ACBS) advises as to the circumstances in which such substances may be regarded as drugs. Prescriptions issued in accordance with the Committee’s advice and endorsed ‘ACBS’ will normally not be investigated.

General Practitioners are reminded that the ACBS recommends products on the basis that they may be regarded as drugs for the management of specified conditions. Doctors should satisfy themselves that the products can safely be prescribed, that patients are adequately monitored and that, where necessary, expert hospital supervision is available.

Foods which may be prescribed on FP10, GP10 (Scotland), or WP10 (Wales) All the food products listed in this appendix have ACBS approval. The clinical condition for which the product has been approved is included with each entry.

Note Foods included in this appendix may contain cariogenic sugars and patients should be advised to take appropriate oral hygiene measures.

Enteral feeds and supplements For most enteral feeds and nutritional supplements, the main source of carbohydrate is either maltodextrin or glucose syrup; other carbohydrate sources are listed in the relevant table, below. Feeds containing residual lactose (less than 1 g lactose/100 mL formula) are described as ‘clinically lactose-free’ or ‘lactose-free’ by some manufacturers. The presence of lactose (including residual lactose) in feeds is indicated in the relevant table, below. The primary sources of protein or amino acids are included with each product entry. The fat or oil content is derived from a variety of sources such as vegetables, soya bean, corn, palm nuts, and seeds; where the fat content is derived from animal or fish sources, this information is included in the relevant table, below. The presence of medium chain triglycerides (MCT) is also noted where the quantity exceeds 30% of the fat content.

Enteral feeds and nutritional supplements can contain varying amounts of vitamins, minerals, and trace elements—the manufacturer’s product literature should be consulted for more detailed information. For further information on enteral nutrition, see section 9.4.2.

Enteral feeds containing vitamin K may affect the INR in patients receiving warfarin; see interactions: Appendix 1 (vitamins).

The suitability of food products for patients requiring a vegan, kosher, halal, or other compliant diet should be confirmed with individual manufacturers.

For details of enteral feeds, nutritional supplements, and specialised formulas suitable for infants and children under 12 years see BNF for Children (Appendix 2)

Note Feeds containing more than 6 g/100 mL protein or 2 g/100 mL fibre should be avoided in children unless recommended by an appropriate specialist or dietician.

Standard ACBS indications
Disease-related malnutrition, intractable malabsorption, pre-operative preparation of malnourished patients, dysphagia, proven inflammatory bowel disease, following total gastrectomy, short-bowel syndrome, bowel fistula
## Appendix 7: Borderline substances

### A7.1 Enteral feeds (non-disease specific)

#### A7.1.1 Enteral feeds (non-disease specific): less than 5 g protein/100 mL

Not suitable for use in child under 1 year; not recommended for child 1–6 years unless otherwise stated.

### Fortisip® Extra (Nutricia Clinical)
- Liquid (sip feed)
- **per 100 mL**
- 675 kJ (160 kcal)
- 10 g cows' milk
- 18.1 g (sugars 9 g)
- 5.3 g nil
- Gluten-free
- Contains lactose
- Standard, p. 903
- Not suitable for child under 3 years
- Bottle: 200 mL = £1.85
- Chocolate, forest fruits, mocha, strawberry, vanilla
- Starter pack: 4 x 200 mL = £7.58

### Fresubin® 2 kcal Drink (Fresenius Kabi)
- Liquid (sip feed)
- **per 100 mL**
- 840 kJ (200 kcal)
- 10 g cows' milk
- 22.5 g (sugars 5.8 g)
- 7.8 g nil
- Gluten-free
- Contains lactose
- Standard, p. 903; also CAPD, haemodialysis
- Bottle: 200 mL = £1.73
- Apricot-peach, cappuccino, fruits of the forest, toffee, vanilla

### Fresubin® Extra (Fresenius Kabi)
- Liquid (sip feed)
- **per 100 mL**
- 840 kJ (200 kcal)
- 10 g cows' milk
- 22.5 g (sugars 5.8 g)
- 7.8 g 1.6 g gluten-free
- Contains lactose
- Standard, p. 903; also CAPD, haemodialysis
- Bottle: 200 mL = £1.73
- Cappuccino, chocolate, lemon, vanilla

### Fresubin® Crème (Fresenius Kabi)
- Semi-solid
- **per 100 g**
- 756 kJ (180 kcal)
- 10 g cows' milk
- 19 g (sugars 14.4 g)
- 7.2 g 2 g gluten-free
- Residual lactose
- Standard, p. 903; also CAPD, haemodialysis
- Bottle: 125 mL = £1.85
- Cappuccino, chocolate, praline, strawberry, vanilla

### Renilon® 7.5 (Nutricia Clinical)
- Liquid (sip feed)
- **per 100 mL**
- 840 kJ (200 kcal)
- 7.5 g cows' milk
- 20 g (sugars 4.8 g)
- 10 g nil
- Gluten-free
- Residual lactose
- Standard, p. 903
- Not suitable for child under 3 years
- Carton: 125 mL = £1.85
- Apricot, caramel

### Resource® 2.0 Fibre (Nestlé)
- Liquid (sip feed)
- **per 100 mL**
- 836 kJ (200 kcal)
- 9 g cows' milk
- 21.4 g (sugars 5.5 g)
- 8.7 g 2.5 g gluten-free
- Residual lactose
- Standard, p. 903
- Not suitable for child under 6 years; use with caution in child 6–10 years
- Carton: 200 mL = £1.80
- Apricot, coffee, neutral, strawberry, summer fruits, vanilla

### Resource® Dessert Fruit (Nestlé)
- Semi-solid
- **per 100 g**
- 678 kJ (160 kcal)
- 5 g cows' milk
- 24 g (sugars 16.4 g)
- 5 g 1.4 g gluten-free
- Residual lactose
- Standard, p. 903; also CAPD, haemodialysis
- Cup: 3 x 125 g = £4.41
- Apple, apple-peach, apple-strawberry

### Vegenat®-med Balanced Protein (Vegenat)
- Powder
- **per 110 g serving**
- 1924 kJ (458 kcal)
- 18 g cows' milk
- 62 g
- 15.35 g 5.8 g gluten-free
- Residual lactose
- Standard, p. 903 except bowel fistula
- Not suitable for child under 14 years
- Sachet: 12 x 110 g = £36.26
- Apple, chocolate, honey, orange

### Vegenat®-med High Protein (Vegenat)
- Powder
- **per 110 g serving**
- 1940 kJ (463 kcal)
- 23.3 g cows' milk
- 57.2 g
- 15.6 g 6 g gluten-free
- Residual lactose
- Standard, p. 903 except bowel fistula
- Not suitable for child under 14 years
- Sachet: 12 x 110 g = £50.76
- Chicken, chickpea, fish, fish-vegetable, ham, lentil, veal, vegetable, winter vegetable
- 12 x 110 g = £48.95
- Curry chicken
- 12 x 110 g = £48.22
- Lemon, rice with lemon
- 24 x 55 g = £46.50
- Rice with apple

### Appendix 7: Borderline substances

**Suplena® (Abbott)**

- **Liquid (sip or tube feed)** per 100 mL
  - 840 kJ (200 kcal)
  - 3 g caseinates
  - 25.5 g (sugars 2.7 g)
  - 9.6 g Nil
- **Gluten-free**
- **Residual lactose**
- **Electrolytes/100 mL:**
  - Na⁺ 3.39 mmol
  - K⁺ 2.87 mmol
  - Ca²⁺ 3.48 mmol
  - P⁺ 2.39 mmol
- **Enteral feed or nutritional supplement in patients with chronic or acute renal failure who are not undergoing dialysis, or with chronic or acute liver disease with fluid restriction; other conditions requiring high energy, low protein, low electrolyte, low volume enteral feed Not suitable for child under 1 year; use with caution in child 1–5 years**
- **Can:** 237 mL = £2.47
- **Vanilla**

**Supportan® (Fresenius Kabi)**

- **Liquid (sip or tube feed)** per 100 mL
  - 630 kJ (150 kcal)
  - 10 g cows' milk
  - 12.4 g (sugars 6.1 g¹)
  - 6.7 g (MCT 34% in tube feed)
  - 1.2 g²
- **Gluten-free**
- **Residual lactose**
- **Contains fish oil**
- **Enteral feed or nutritional supplement in patients with pancreatic cancer or with lung cancer undergoing chemotherapy Not suitable for child under 1 year; use with caution in child 1–4 years**
- **Bottle:** 200 mL = £2.30
- **Cappuccino, tropical fruits**
- **Flexible pack:** 500 mL = £5.97
- **Unflavoured**

A7.5 Feed additives

A7.5.1 Special additives for conditions of intolerance

Colief® (Forum)
**Liquid**, lactase 50 000 units/g. Net price 7-mL dropper bottle = £8.40
For the relief of symptoms associated with lactose intolerance in infants, provided that lactose intolerance is confirmed by the presence of reducing substances and/or excessive acid in stools, a low concentration of the corresponding disaccharide enzyme on intestinal biopsy or by breath hydrogen test or lactose intolerance test. For dosage and administration details, consult product literature.

Fructose (Laevulose)
For proven glucose/galactose intolerance.

VSL#3® (Ferring)
**Powder**, containing 8 strains of live, freeze-dried, lactic acid bacteria. Contains traces of soya, gluten, and lactose. Net price 30 × 4.4-g sachets = £22.98
Nutritional supplement for use under the supervision of a physician, for the maintenance of remission of ileoanal pouchitis induced by antibacterials in adults. For dosage and administration details, consult product literature.

A7.5.2 Feed thickeners and pre-thickened drinks

For pre-thickened infant feeds see *BNF for Children* (Appendix 2)

Carobel, Instant® (Cow & Gate)
**Powder**, carob seed flour. Net price 135 g = £2.97
For thickening feeds in the treatment of vomiting.

Nutilis® (Nutricia Clinical)
**Powder**, modified maize starch, gluten- and lactose-free, Net price 20 × 9-g sachets = £5.88; 225 g = £4.51
For thickening of foods in dysphagia. Not suitable for children under 3 years.

Resource® Thickened Drink (Nestlé)
**Liquid**, carbohydrate 22 g, energy: orange 382 kJ (90 kcal); apple 375 kJ (90 kcal)/100 mL. Syrup and custard consistencies. Gluten- and lactose-free, net price 12 × 114-mL cups = £7.44
For dysphagia. Not suitable for children under 1 year.

Resource® ThickenUp® (Nestlé)
**Powder**, modified maize starch. Gluten- and lactose-free, net price 227 g = £4.35; 75 × 4.5-g sachet = £16.66
For thickening of foods in dysphagia. Not suitable for children under 1 year.

SLO Drinks® (SLO Drinks)
**Powder**, carbohydrate content varies with flavour and chosen consistency (3 consistencies available), see product literature. Flavours: black currant, lemon, orange; (hot drinks) chocolate, white coffee. Net price 25 × 115 mL = £7.50
Nutritional supplement for patient hydration in the dietary management of dysphagia. Not suitable for children under 3 years.

Thick and Easy® (Fresenius Kabi)
**Powder**, modified maize starch, net price 225-g can = £4.46; 100 × 9-g sachets = £26.35; 4.54 kg = £70.53.

Thickened Juices, liquid, modified food starch. Flavours: apple, orange, net price 118-mL pot = 58p; apple, black currant, cranberry, kiwi-strawberry, and orange, 1.42-litre bottle = £3.61.
For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive.

Thixo-D® (Sutherland)
**Powder**, modified maize starch, gluten-free. Net price 375-g tub = £7.15.
For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive.

Vitaquick® (Vitafo) **Powder**, modified maize starch. Net price 300 g = £6.66; 2 kg = £33.91; 6 kg = £87.83.
For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive.

A7.5.3 Flavouring preparations

Flavour Mix® (Nestlé)

FlavourPac® (Vitafo)
**Powder**, flavours: black currant, lemon, orange, tropical or raspberry, net price 30 × 4-g sachets = £11.54.
For use with Vitafo’s range of unflavoured protein substitutes for metabolic diseases.

Modjul® Flavour System (SHS)
**Powder**, flavours: black currant, orange, pineapple, 100 g = £10.24; cherry-vanilla, grapefruit, lemon-lime, 20 × 5-g sachets = £10.24.
For use with unflavoured SHS products based on peptides or amino acids; not suitable for child under 6 months.

A7.6 Foods for special diets

A7.6.1 Gluten-free foods

ACBS indications: established gluten-sensitive enteropathies including steatorrhoea due to gluten sensitivity, coeliac disease, and dermatitis herpetiformis.

Bread

Loaves
Barkat® (Gluten Free Foods Ltd)
**Gluten-free**. Loaf, multigrain 500 g = £4.83. Loaf, sliced, wholemeal 500 g = £3.36. Loaf, sliced, part-baked, country-style 250 g = £3.69. Loaf, sliced, part-baked, white 550 g = £4.88. Rice bread, brown 500 g = £4.83; white 500 g = £4.83.

Dietary Specials® (Nutrition Point)
**Gluten-free**. Loaf, sliced, multigrain, brown 400 g = £3.01; white 400 g = £3.01.

Ener-G® (General Dietary)
**Gluten-free**. Loaf, sliced Seattle brown 600 g = £5.28. Rice bread, sliced, brown 474 g = £4.59; white 456 g = £4.59. Rice loaf, sliced 612 g = £4.59. Tapioca bread, sliced 480 g = £4.59.
Appendix 7: Borderline substances

Genius Gluten Free® (Genius Foods)

- **Gluten-free**: Loaf, unsliced, brown 400 g = £2.49; white 400 g = £2.49

Glutafin® (Nutrition Point)

- **Gluten-free**: Loaf, sliced, fibre 400 g = £3.41; white 400 g = £3.41

Glutafin® Select (Nutrition Point)

- **Gluten-free**: Loaf, sliced, fresh, brown 400 g = £3.25; white 400 g = £3.25. Loaf, sliced, fibre 400 g = £3.12; white 400 g = £3.12. Loaf, seeded 400 g = £3.39.

Juvela® (Juvela)

- **Gluten-free**: Loaf, sliced, fresh, fibre 400 g = £2.97; white 400 g = £3.23. Loaf, sliced, white 400 g = £3.10, fibre 400 g = £3.10. Loaf, part-baked, fibre 400 g = £3.33; white 400 g = £3.46

Lifestyle® (Ultrapharm)

- **Gluten-free**: Loaf, sliced, brown 400 g = £2.82; high fibre 400 g = £2.82; white 400 g = £2.82. Loaf, brown 400 g = £2.82; high fibre 400 g = £2.82, white 400 g = £2.82

Livwell® (Livwell)

- **Gluten-free**: Loaf, sliced, brown (seeded) 200 g = £2.25; white 200 g = £2.25

Pasticely® (GFF Trade)

- **Gluten-free**: Loaf, sandwich, sliced, white 260 g = £3.29; rustic, sliced, white 260 g = £3.29

Sunnyvale® (Everfresh)

- **Gluten-free**: Loaf, mixed grain, sour dough 400 g = £1.91

Ultra® (Ultrapharm)

- **Gluten-free**: Loaf, part-baked, white 400 g = £2.46; high fibre 500 g = £3.35

Wellfoods® (Wellfoods)

- **Gluten-free**: Loaf, sliced 600 g = £4.95; unsliced 600 g = £4.85

Baguettes, buns and rolls

Barkat® (Gluten Free Foods Ltd)

- **Gluten-free**: Baguette, part-baked 200 g = £3.69. Rolls, part-baked 2 x 100 g = £3.30; 6 x 50 g = £3.69

Ener-G® (General Dietary)

- **Gluten-free**: Rolls, dinner × 6 = £3.11; white, long 4 × 55 g = £2.50; round 4 × 50 g = £2.50

Glutafin® (Nutrition Point)

- **Gluten-free**: Baguette 2 x 175 g = £3.20. Rolls, fibre 4 × 50 g = £3.41; white 4 × 50 g = £3.41

Glutafin® Select (Nutrition Point)

- **Gluten-free**: Rolls, fibre 4 × 65 g = £3.25; white 4 × 65 g = £3.25. Rolls, part-baked, white 4 × 50 g = £3.35; long 2 × 75 g = £2.56

Juevella® (Juvela)

- **Gluten-free**: Rolls, fresh, fibre 5 × 85 g = £4.17; white 5 × 85 g = £4.17. Rolls, fibre 5 × 85 g = £4.18; white 5 × 85 g = £4.18. Rolls, part-baked, fibre 5 × 75 g = £4.33; white 5 × 75 g = £4.33

Lifestyle® (Ultrapharm)

- **Gluten-free**: Rolls, brown 5 × 80 g = £2.82; high fibre 5 × 80 g = £2.82; white 5 × 80 g = £2.82

Livwell® (Livwell)

- **Gluten-free**: Baguette, white 250 g = £2.50. Buns, toasting 4 × 50 g = £2.50. Rolls, white 4 × 2.25. Rolls, part-baked, circle (bagel) 2 × 90 g = £2.50; dinner (square) 2 × 80 g = £2.09

Pasticely® (GFF Trade)

- **Gluten-free**: Baguette, part-baked, white 160 g = £1.99. Rolls, part-baked, white 2 × 80 g = £2.39; rustic, part-baked, white 2 × 105 g = £2.39

Procell® (Procell)

- **Gluten-free**: Baguette, part-baked 2 × 125 g = £3.24. Buns 4 × 50 g = £3.26. Lunch rolls, white 8 × 34 g = £3.26. Rolls, part-baked, white, dinner 4 × 35 g = £2.18; hotdog 3 × 35 g = £2.24; long 3 × 85 g = £2.95

Ultra® (Ultrapharm)

- **Gluten-free**: Baguette, part-baked 2 × 200 g = £2.46. Rolls, part-baked 4 × 70 g = £2.46

Wellfoods® (Wellfoods)

- **Gluten-free**: Burger buns 4 × 75 g = £3.95. Rolls 4 × 70 g = £3.46

Speciality breads

Livwell® (Livwell)

- **Gluten-free**: Flat bread (pitta) 4 = £3.00. Tear-drop shape (naan) 2 × 90 g = £3.00

Procell® (Procell)

- **Gluten-free**: Flat bread (pitta), part-baked 3 × 40 g = £4.36

Cookies and biscuits

Barkat® (Gluten Free Foods Ltd)

- **Gluten-free**: Biscuits, coffee-style 200 g = £2.86; digestive 175 g = £2.20

Ener-G® (General Dietary)

- **Gluten-free**: Cookies, vanilla 435 g = £5.23

Glutafin® (Nutrition Point)

- **Gluten-free**: Biscuits, plain 200 g = £3.77; digestive 150 g = £1.94; savoury 125 g = £1.94; savoury shortbread 150 g = £2.65; shortbread 100 g = £1.60, sweet (without chocolate or sugar) 150 g = £1.94; tea 150 g = £1.94

Juevella® (Juvela)

- **Gluten-free**: Biscuits, digestive 150 g = £2.67; savoury 150 g = £3.35; sweet 150 g = £2.52; tea 150 g = £2.67

Ultra® (Ultrapharm)

- **Gluten-free**: Biscuits, sweet 250 g = £2.93

Crackers, crispbreads, and breadsticks

Barkat® (Gluten Free Foods Ltd)

- **Gluten-free**: Crackers, round (matzo) 200 g = £2.97

Dietary Specials® (Nutrition Point)

- **Gluten-free**: Cracker bread 150 g = £1.94

Glutafin® (Nutrition Point)

- **Gluten-free**: Crackers, high fibre 200 g = £2.64; plain 200 g = £3.16; mini 175 g = £2.70

Juevella® (Juvela)

- **Gluten-free**: Crispbread, plain 200 g = £4.06

Ultra® (Ultrapharm)

- **Gluten-free**: Crackerbread 200 g = £1.77

Flour mixes and xanthan gum

Flour mixes

Barkat® (Gluten Free Foods Ltd)

- **Gluten-free**: Flour mix, bread 500 g = £5.74. Plain 750 g = £5.88

Dietary Specials® (Nutrition Point)

- **Gluten-free**: Flour mix, bread, white 500 g = £5.33. Cake, white 750 g = £5.33. Plain, white 500 g = £5.33
**Pasta**

**Barkat**® (Gluten Free Foods Ltd)

**Gluten-free**. Pasta, animal shapes 500 g = £4.95; macaroni 500 g = £4.95; spaghetti 500 g = £4.95; tagliatelle 500 g = £4.95. Buckwheat, penne 250 g = £2.48; spirals 250 g = £2.48.

**BiAlimenta**® (Drossa)

**Gluten-free**. Pasta, potato-based, gnocchi 500 g = £5.59; perle di gnocchi 500 g = £5.60; Tubetti 500 g = £5.90.

**Dietary Specials**® (Nutrition Point)

**Gluten-free**. Pasta, fusilli 500 g = £3.44; penne 500 g = £3.44; spaghetti 500 g = £3.44.

**Ener-G**® (General Dietary)

**Gluten-free**. Pasta, rice-based, lasagne 545 g = £4.27; macaroni 454 g = £4.27; shells, small 454 g = £4.27; spaghetti 454 g = £4.27; vermicelli 300 g = £4.27.

**Glutafin**® (Nutrition Point)

**Gluten-free**. Pasta, lasagne 250 g = £3.21; macaroni penne 500 g = £6.13; shells 500 g = £6.13; spirals 500 g = £6.13; spaghetti, long 500 g = £6.13; tagliatelle 250 g = £3.21.

**Juvela**® (Juvela)

**Gluten-free**. Pasta, fusilli 500 g = £6.31; lasagne 250 g = £3.22; macaroni 500 g = £6.31; spaghetti 500 g = £6.31; tagliatelle 250 g = £3.04. Fibre, linugine 500 g = £5.79; penne 500 g = £5.79.

**Ogron**® (Community)

**Gluten-free**. Pasta, rice and corn, lasagne 200 g = £3.03; macaroni 250 g = £2.35. Spirals, buckwheat 250 g = £2.35; corn 250 g = £2.35; rice and corn 250 g = £2.35; rice and millet 250 g = £2.35.

**Pastically**® (GFF Trade)

**Gluten-free**. Pasta, macaroni penne 250 g = £2.99; penne 250 g = £2.99; spaghetti 500 g = £2.99.

**Proceli**® (Proceli)

**Gluten-free**. Pasta, macaroni penne 250 g = £2.99; penne 250 g = £2.99; spaghetti 500 g = £2.99.

**Rizopia**® (PGR Health Foods)

**Gluten-free**. Pasta, brown rice, fusilli 500 g = £2.60; lasagne 375 g = £2.60; penne 500 g = £2.60; spaghetti 500 g = £2.60.

**Ultra**® (Ultrainpharm)

**Gluten-free**. Pasta, fusilli 250 g = £2.95; penne 250 g = £2.95; spaghetti 250 g = £2.95.

**Pizza bases**

**Barkat**® (Gluten Free Foods Ltd)

**Gluten-free**. Pizza crust, rice, brown 150 g = £4.21; white 150 g = £4.21.

**Dietary Specials**® (Nutrition Point)

**Gluten-free**. Pizza base 2 × 150 g = £5.27.

**Glutafin**® (Nutrition Point)

**Gluten-free**. Pizza base 2 × 150 g = £5.98.

**Juvela**® (Juvela)

**Gluten-free**. Pizza base 2 × 180 g = £7.70.

**Pastically**® (GFF Trade)

**Gluten-free**. Pizza base 165 g = £2.99.

**Proceli**® (Proceli)

**Gluten-free**. Pizza base 2 × 250 g = £3.90.

**Ultra**® (Ultrainpharm)

**Gluten-free**. Pizza base 2 × 200 g = £2.65.

**Wellfoods**® (Wellfoods)

**Gluten-free**. Pizza base 2 × 300 g = £8.95.

**A7.6.1.1 Gluten- and wheat-free foods**

**ACBS indications**: established gluten-sensitive enteropathies with coexisting established wheat sensitivity only.

**Ener-G**® (General Dietary)

**Gluten-free, wheat-free**. Bread loaf, six flour 576 g = £3.60. Rolls, Seattle brown, round (hamburger) 4 × 119 g = £3.00; long (hot dog) 4 × 119 g = £3.00. Pizza base, 3 × 124 g = £3.75.

**Glutafin**® (Nutrition Point)

**Gluten-free, wheat-free**. Flour mix, bread 500 g = £6.06; fibre 500 g = £6.06. Cake mix 500 g = £6.06. Crispbread 150 g = £3.82.

**Heron Foods**® (Gluten Free Foods Ltd)

**Gluten-free, wheat-free**. Flour mix, organic, bread, fibre 500 g = £8.30. Bread and cake mix 500 g = £8.33.

### ACBS indications: inherited metabolic disorders, renal or liver failure, requiring a low-protein diet
**A7.7 Nutritional supplements for metabolic diseases**

### Glutaric aciduria (type 1)

**GA1 Anamix** (Infant) (SHS)
- Powder, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 13.1 g, carbohydrate 49.5 g, fat 23.5 g, fibre 5.3 g, energy 192.5 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements.
- Standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 0.8 mg, energy 28.7 kJ (69 kcal)/100 mL. Unflavoured, net price £4.52.70 (5-g measuring scoop provided).

Nutritional supplement for the dietary management of proven glutaric aciduria in children from birth to 3 years.

### XLYS, Low TRY, Maxamaid (SHS)
- Powder, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 8.4 g, carbohydrate 8.6 g, fat, trace, energy 286 kJ (68 kcal)/20 g, with vitamins, minerals, and trace elements. Unflavoured (flavours see FlavourPac, p. 925), net price £0.30 x 20 g = £14.90. Nutritional supplement for the dietary management of type 1 glutaric aciduria in children 1–10 years.

### Glycogen storage disease

#### Corn flour and corn starch

For hypoglycaemia associated with glycogen-storage disease.

#### Glucose

**Dextrose monohydrate**
- 1457 g/m², protein 200 mg, with vitamins, minerals, and trace elements.

For glycogen storage disease and sucrose/isomaltose intolerance.

#### Glycosade® (Vitaflo)
- Powder, protein 200 mg, carbohydrate (maize starch) 47.6 g, fat 100 mg, fibre less than 600 mg, energy 803 kJ (192 kcal)/60 g, net price 30 x 60 g = £9.23.03.

Nutritional supplement for use in the dietary management of glycogen storage disease and other metabolic conditions where a constant supply of glucose is essential. Not suitable for children under 2 years.

#### Homocystinuria or hypermethioninaemia

**HCU Anamix** (Infant) (SHS)
- Powder, protein equivalent (essential and non-essential amino acids except methionine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 191.5 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements.

Nutritional supplement for the dietary management of proven homocystinuria or hypermethioninaemia in children from birth to 3 years.

### Amino acid substitutions

### Hyperlysinaemia

**HYPER LYS Anamix** (Infant) (SHS)
- Powder, protein equivalent (essential and non-essential amino acids except lysine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 191.5 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements.

Nutritional supplement for the dietary management of proven hyperlysinaemia in children from birth to 3 years.

---

1. Maxamaid products are generally intended for use in children 1–8 years.
2. Maxamaid products are generally intended for use in children over 8 years and adults.
Appendix 7: Borderline substances

3 XLYS Maxamaid (SHS)
Powder, protein equivalent (essential and non-essential amino acids except lysine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1836 kJ (438 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see Modju® Flavour System, p. 925), net price 500 g = £82.57
Nutritional supplement for the dietary management of hyperlysinaemia

3 Isovaleric acidaemia
IVA Anamix® Infant (SHS)
Powder, protein equivalent (essential and non-essential amino acids except leucine) 13.1 g, carbohydrate 48.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements, standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £32.70 (5-g measuring scoop provided)
Nutritional supplement for the dietary management of isovaleric acidaemia or other proven disorders of leucine metabolism in children from birth to 3 years

XLEU Falaton (SHS)
Powder, protein equivalent (essential and non-essential amino acids except leucine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured (flavouring: see Modju® Flavour System, p. 925), net price 200 g = £62.55
Nutritional supplement for the dietary management of isovaleric acidaemia

3 XLEU Maxamaid (SHS)
Powder, protein equivalent (essential and non-essential amino acids except leucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see Modju® Flavour System, p. 925), net price 500 g = £82.57
Nutritional supplement for the dietary management of isovaleric acidaemia

Maple syrup urine disease
Isoleucine Amino Acid Supplement (Vitaflò)
Powder, isoleucine 50 mg, carbohydrate 4 g, fat nil, energy 64 kJ (15 kcal)/4 g, net price 30 × 4-g sachets = £44.48
Nutritional supplement for the dietary management of maple syrup urine disease and related conditions in children and adults where it is necessary to limit the intake of branched chain amino acids

MSUD Aid III® (SHS)
Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 77 g, carbohydrate 4.5 g, energy 1380 kJ (326 kcal)/100 g, Unflavoured, (flavouring: see Modju® Flavour System, p. 925), net price 500 g = £115.42
Nutritional supplement for the dietary management of maple syrup urine disease and related conditions in children and adults where it is necessary to limit the intake of branched chain amino acids

MSUD Anamix® Infant (SHS)
Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 KJ (457 kcal)/100 g, with vitamins, minerals, and trace elements, standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £32.70 (5-g measuring scoop provided)
Nutritional supplement for the dietary management of proven maple syrup urine disease in children from birth to 3 years

MSUD Anamix® Junior (SHS)
Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 8.4 g, carbohydrate 11 g, fat 3.9 g, energy 474 kJ (113 kcal)/29-g sachet, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see Modju® Flavour System, p. 925), net price 30 × 29-g sachets = £168.73
Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years

MSUD Anamix® Junior LO (SHS)
Liquid, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 497 kJ (118 kcal)/125 mL, with vitamins, minerals, and trace elements. Lactose-free. Orange flavour, net price 125-mL carton = £7.58
Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years

MSUD express® (Vitaflò)
Powder, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 15 g, carbohydrate 3.8 g, fat less than 150 mg, energy 315 kJ (75 kcal)/25 g with vitamins, minerals, and trace elements. Unflavoured (flavouring: see FlavourPac® sachets, p. 925), net price 30 × 25-g sachets = £271.88
Nutritional supplement for the dietary management of maple syrup urine disease in children over 8 years and adults

MSUD cooler® (Vitaflò)
Liquid, protein equivalent (essential and non-essential amino acids except leucine, isoleucine, and valine) 15 g, carbohydrate 7 g, fat 500 mg, energy 386 kJ (92 kcal)/130-mL pouch, with vitamins, minerals, and trace elements. Orange or red flavour, net price 30 × 130-mL = £277.20
Nutritional supplement for the dietary management of maple syrup urine disease in children over 3 years and adults

MSUD Gel® (Vitaflò)
Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 25 g, carbohydrate 8.6 g, fat less than 150 mg, energy 286 kJ (68 kcal)/29 g with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see Modju® Flavour System, p. 925), net price 500 g = £82.57
Nutritional supplement for the dietary management of maple syrup urine disease in children 1–10 years

2 MSUD Maxamaid® (SHS)
Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see Modju® Flavour System, p. 925), net price 500 g = £132.36
Nutritional supplement for the dietary management of maple syrup urine disease

2 MSUD Maxamun® (SHS)
Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Orange flavour or unflavoured (flavouring: see Modju® Flavour System, p. 925), net price 500 g = £132.36
Nutritional supplement for the dietary management of maple syrup urine disease and other inborn errors of amino acid metabolism in children over 1 year and adults

Valine Amino Acid Supplement (Vitaflò)
Powder, valine 50 mg, carbohydrate 4 g, fat nil, energy 64 kJ (15 kcal)/4 g, net price 30 × 4-g sachets = £44.48
Nutritional supplement for the dietary management of maple syrup urine disease and other inborn errors of amino acid metabolism in children over 8 years and adults

1 Maxamaid products are generally intended for use in children 1–8 years

2 Maxamum products are generally intended for use in children over 8 years and adults
Methylmalonic or propionic acididaemia

**MMA/PA Anamix® Infant (SHS)**

Powder, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 13.1 g, carbohydrate 49.5 g, fat 23.6 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £32.70 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of proven methylmalonic acididaemia or propionic acididaemia in children from birth to 3 years

**XMTVI Asadon (SHS)**

Powder, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured, (flavouring: see Modju® Flavour System, p. 925), net price 200 g = £82.55

Nutritional supplement for the dietary management of methylmalonic acididaemia or propionic acididaemia in children and adults

**XMTVI Maxamum (SHS)**

Powder, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, (flavouring: see Modju® Flavour System, p. 925), net price 500 g = £132.36

Nutritional supplement for the dietary management of methylmalonic acididaemia or propionic acididaemia

**XMTVI Maxamum® (SHS)**

Powder, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 39 g, carbohydrate 34.9 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see Modju® Flavour System, p. 925), net price 500 g = £32.20

Nutritional supplement for the dietary management of methylmalonic acididaemia or propionic acididaemia

**Other inborn errors of metabolism**

**Cystine Amino Acid Supplement (Vitaflo)**

Powder, cystine 500 mg, carbohydrate 3.4 g, fat nil, energy 63 kJ (15 kcal)/4 g, net price 30 x 4-g sachets = £44.48

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children over 1 year

**DocOmega® (Vitafo)**

Powder, proteins (cows’ milk, soya protein) 100 mg, carbohydrate 12.2 g, fat 500 mg (of which docosahexaenoic acid 200 mg), fibre nil, energy 74 kJ (18 kcal)/4 g, with minerals, net price 30 x 4-g sachets = £32.20

Nutritional supplement for the dietary management of inborn errors of metabolism for adults and children from birth

**EAA® Supplement (Vitafo)**

Powder, protein equivalent (essential amino acids) 5 g, carbohydrate 4 g, fat nil, energy 151 kJ (36 kcal)/12.5 g, with vitamins, minerals, and trace elements. Tropical flavour, net price 50 x 12.5-g sachets = £174.48

Nutritional supplement for the dietary management of disorders of protein metabolism including urea cycle disorders. Not suitable for children under 3 years

**KeyOmega® (Vitafo)**

Powder, proteins (cows’ milk, soya) 170 mg, carbohydrate 2.8 g, fat 800 mg (of which arachidonic acid 200 mg, docosahexaenoic acid 100 mg), energy 80 kJ (19 kcal)/4 g, net price 30 x 4-g sachets = £32.92

A nutritional supplement for the dietary management of inborn errors of metabolism

1. Maxamum products are generally intended for use in children 1–8 years
2. Maxamum products are generally intended for use in children over 8 years and adults

**Leucine Amino Acid Supplement (Vitafo)**

Powder, leucine 100 mg, carbohydrate 4 g, fat nil, energy 64 kJ (15 kcal)/4 g, net price 30 x 4-g sachets = £44.48

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in children over 1 year and adults

**Low protein drink (Milupa )**

Powder, protein (cows’ milk) 4.5 g (phenylalanine 100 mg), carbohydrate 59.5 g, fat 28.9 g, fibre nil, energy 2194 kJ (528 kcal)/100 g, with vitamins, minerals, and trace elements. Contains lactose. Net price 400 g = £7.76 (5-g measuring scoop provided)

Nutritional supplement for the dietary management of inborn errors of amino acid metabolism

**Phenylalanine Amino Acid Supplement (Vitafo)**

Powder, phenylalanine 50 mg, carbohydrate 3.8 g, energy 64 kJ (15 kcal)/4 g, net price 30 x 4-g sachets = £43.18

Nutritional supplement for use in the dietary management of inborn errors of metabolism only

**ProZero® (Vitafo)**

Liquid, carbohydrate 8.1 g (of which sugars 3.5 g), fat 3.8 g, energy 278 kJ (66 kcal)/100 mL. Contains lactose. Net price 18 x 250 mL = £22.50; 6 x 1 litre = £30.00

A protein-free nutritional supplement for the dietary management of inborn errors of metabolism in children over 6 months and adults

**Phenylketonuria**

**Add-Ins® (SHS)**

Powder, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 41 g, fat 5.1 g, energy 359 kJ (86 kcal)/18.2-g sachet, with vitamins, minerals, and trace elements. Unflavoured (flavouring: see Modju® Flavour System, p. 925), net price 60 x 18.2-g sachets = £315.60

Nutritional supplement for the dietary management of proven phenylketonuria. Not suitable for children under 4 years

**Easiphen® (SHS)**

Liquid, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 6.7 g, carbohydrate 5.1 g, fat 2 g, energy 275 kJ (65 kcal)/100 mL, with vitamins, minerals, and trace elements. Forest berries flavour, net price 250-mL carton = £8.11

Nutritional supplement for the dietary management of proven phenylketonuria. Not suitable for children under 8 years

**Lophlex® (SHS)**

Powder, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 2.5 g, fat 60 mg, energy 385 kJ (91 kcal)/27.8-g sachet, with vitamins, minerals, and trace elements. Flavours: berry, orange or unflavoured, net price 30 x 27.8-g sachets = £243.60

Nutritional supplement for the dietary management of proven phenylketonuria in children over 8 years and adults including pregnant women

**Loprofin® PKU Drink (SHS)**

Liquid, protein (cows’ milk) 400 mg (phenylalanine 10 mg), lactose 9.4 g, fat 2 g, energy 165 kJ (40 kcal)/100 mL. Net price 200-mL carton = 61p.

Nutritional supplement for the dietary management of phenylketonuria in children over 1 year and adults

**Milupa PKU 2-prima® (Milupa )**

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 60 g, carbohydrate 10 g, fat nil, energy 1190 kJ (280 kcal)/100 g, with vitamins, minerals, and trace elements. Vanilla flavour, net price 500 g = £131.68

Nutritional supplement for the dietary management of phenylketonuria in children 1–8 years

Note

1. Nutritional values vary with flavour—consult product literature
### Appendix 7: Borderline substances

#### Milupa PKU 2-secunda® (Milupa)
- **Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 70 g, carbohydrate 4.7 g, fat nil, energy 1270 kJ (299 kcal)/100 g, with vitamins, minerals, and trace elements. Vanilla flavour, net price 500 g = £153.62.
Nutritional supplement for the dietary management of phenylketonuria in children 9–14 years

#### Milupa PKU 3-advanta® (Milupa)
- **Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 70 g, carbohydrate 4.7 g, fat nil, energy 1270 kJ (299 kcal)/100 g, with vitamins, minerals, and trace elements. Vanilla flavour, net price 500 g = £153.62.
Nutritional supplement for the dietary management of phenylketonuria in patients 15 years and over

#### Phlexy-Vits® (SHS)
- **Capsules**, protein equivalent (essential and non-essential amino acids except phenylalanine) 833 mg/capsule. Net price 75-tab pack = £23.17
- **Tablets**, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 8.8 g/20-g sachet. Apple-black currant, citrus, or tropical flavour. Net price 30 x 20-g sachets = £107.86
Nutritional supplement for the dietary management of phenylketonuria

#### Phlexy-10® Exchange System (SHS)
- **Capsules**, protein equivalent (essential and non-essential amino acids except phenylalanine) 416.5 mg/capsule. Net price 200-cap pack = £35.77
- **Tablets**, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.4 g, carbohydrate 9.9 g, amino acids except phenylalanine) 79 g, carbohydrate 4.5 g, amino acids except phenylalanine) 20 g, carbohydrate 10.2 g, amino acids except phenylalanine) 2 g, carbohydrate 8.6 g, amino acids except phenylalanine) 15 g, carbohydrate 7.8 g, amino acids except phenylalanine) 416.5 mg/capsule. Net price 75-tab pack = £23.17
**Drink Mix**, powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.3 g, carbohydrate 8.6 g/29-g sachet. Apple-black currant, citrus, or tropical flavour. Net price 30 x 20-g sachets = £107.86
Nutritional supplement for the dietary management of phenylketonuria

#### PKU Anamix® Infant (SHS)
- **Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 79 g, carbohydrate 4.5 g, fat nil, energy 1420 kJ (334 kcal)/100 g. Unflavoured, (flavouring: see Modjul® Flavour System, p. 925), net price 500 g = £120.24 (5-g measuring scoop provided).
Nutritional supplement for the dietary management of phenylketonuria in infants

#### PKU Anamix® Junior (SHS)
- **Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 11.1 g, carbohydrate 48.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements. **Standard dilution** (15%) provides protein equivalent 2 g, carbohydrate 74 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £28.72 (5-g measuring scoop provided)
Nutritional supplement for the dietary management of proven phenylketonuria in children from birth to 3 years

#### PKU Anamix® Junior LQ (SHS)
- **Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 497 kJ (118 kcal)/125 mL, with vitamins, minerals, and trace elements. Lactose-free. Flavours: berry, orange, or unflavoured, net price 125 mL carton = £4.72
Nutritional supplement for the dietary management of phenylketonuria in children 1–10 years

#### PKU Anamix® Junior QC (SHS)
- **Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 497 kJ (118 kcal)/125 mL, with vitamins, minerals, and trace elements. Lactose-free. Flavours: berry, orange, or unflavoured, net price 125 mL carton = £4.72
Nutritional supplement for the dietary management of phenylketonuria in children 1–10 years

#### PKU cooler10® (Vitaflo)
- **Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 5.1 g, energy 258 kJ (62 kcal)/87-mL pouch, with vitamins, minerals, and trace elements. Unflavoured (white) or flavoured (orange, purple, or red), net price 30 x 87 mL = £112.80.
Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years

#### PKU cooler15® (Vitaflo)
- **Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 7.8 g, energy 386 kJ (92 kcal)/150-mL pouch, with vitamins, minerals, and trace elements. Unflavoured (white) or flavoured (orange, purple, or red), net price 30 x 130 mL = £168.00.
Nutritional supplement for the dietary management of phenylketonuria, not recommended for children under 3 years

#### PKU cooler20® (Vitaflo)
- **Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 10.2 g, energy 517 kJ (124 kcal)/174-mL pouch, with vitamins, minerals, and trace elements. Lemon, orange, tropical or unflavoured (flavouring; see Flavour Pac®. p. 925), net price 30 x 25-g sachets = £164.84.
Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 8 years

#### PKU express® (Vitaflo)
- **Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 8.6 g, fat less than 100 mg, energy 286 kJ (68 kcal)/20-g sachet
Nutritional supplement for the dietary management of phenylketonuria in children 1–10 years

#### PKU gel® (Vitaflo)
- **Powder**, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 8.6 g, fat less than 100 mg, energy 286 kJ (68 kcal)/100 mL with vitamins, minerals and trace elements. Orange, raspberry, or unflavoured (flavouring; see Flavour Pac®, p. 925), net price 30 x 20-g sachets = £95.03.
Nutritional supplement for use as part of the low-protein dietary management of phenylketonuria

#### PKU Lophlex® LQ 10 (SHS)
- **Liquid**, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 4.4 g, fibre 170 mg, energy 245 kJ (58 kcal)/62.5 mL, with vitamins, minerals, and trace elements. Flavours: berry, citrus, orange, or tropical, net price 62.5-mL carton = £4.35
Nutritional supplement for dietary management of phenylketonuria in children 4 years and adults including pregnant women

#### PKU Lophlex® LQ 20 (SHS)
- **Liquid**, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 8.8 g, fibre 340 mg, energy 495 kJ (115 kcal)/125 mL, with vitamins, minerals, and trace elements. Flavours: berry, citrus, orange, or tropical, net price 3 x 125 mL = £26.04
Nutritional supplement for the dietary management of phenylketonuria in children over 4 years and adults including pregnant women

#### PKU Start® (Vitaflo)
- **Liquid**, protein equivalent (essential and non-essential amino acids except phenylalanine) 2 g, carbohydrate 8.3 g, fat 2.9 g, energy 286 kJ (68 kcal)/100 mL with vitamins, minerals, and trace elements. Contains lactose and fish oil. Net price 500-mL bottle = £5.58
Nutritional supplement for the dietary management of phenylketonuria in children under 1 year
Sno-Pro® (SHS)

Liquid, protein (cows’ milk) 220 mg, phenylalanine 12.5 mg, carbohydrate 8.2 g, fat 3.8 g, energy 273 kJ (65 kcal)/100 mL.

Contains lactose. Net price 200 mL = £1.05p

Nutritional supplement for the dietary management of phenylketonuria, chronic renal failure, and other inborn errors of amino acid metabolism

L-Tyrosine (SHS)

Powder, net price 100 g = £18.41

For use as a supplement in maternal phenylketonurics who have low plasma tyrosine concentrations

Tyroside Amino Acid Supplement (Vitaflo)

Powder, tyrosine 1 g, carbohydrate 2.9 g, energy 62 kJ (15 kcal)/100 g, with vitamins, minerals, and trace elements. Orange or unflavoured (flavoured: see Modjul® Flavour System, p. 925), net price 500 g = £48.85

Nutritional supplement for the dietary management of phenylketonuria and other inborn errors of amino acid metabolism

XP Maxamaid® (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 25 g, carbohydrate 51.8 g, fat less than 500 mg, energy 1511 kJ (368 kcal)/100 g, with vitamins, minerals, and trace elements. Orange or unflavoured (flavoured: see Modjul® Flavour System, p. 925), net price 30 x 50-g sachets = £226.50, 500 g = £75.54

Nutritional supplement for the dietary management of phenylketonuria in children 1-8 years

XP Maximum® (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 39 g, carbohydrate 34.8 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Flavours: orange, unflavoured (flavoured: see Modjul® Flavour System, p. 925), net price 30 x 50-g sachets = £226.50, 500 g = £75.54

Nutritional supplement for the dietary management of phenylketonuria in children 1-8 years

Tyrosinaemia

Methionine-free TYR Anamix Infant (SHS)

Powder, protein equivalent (essential and non-essential amino acids except methionine, phenylalanine, and tyrosine) 13.1 g, carbohydrate 49.5 g, fat 23.1 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements. Standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 0.8 g, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £32.70 (5-g measuring spoon provided)

Nutritional supplement for the dietary management of proven tyrosinaemia type 1 in children from birth to 3 years

TYR Anamix® Infant (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine, and tyrosine) 13.1 g, carbohydrate 49.5 g, fat 23.1 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements, standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 0.8 g, energy 287 kJ (69 kcal)/100 mL. Unflavoured, net price 400 g = £32.70 (5-g measuring spoon provided)

Nutritional supplement for the dietary management of proven tyrosinaemia where plasma-methionine concentrations are normal in children from birth to 3 years

TYR Anamix® Junior (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 8.4 g, carbohydrate 11.1 g, fat 3.9 g, energy 475 kJ (113 kcal)/20-g sachet, with vitamins, minerals, and trace elements. Unflavoured, net price 30 x 20-g sachets = £173.32

Nutritional supplement for the dietary management of proven tyrosinaemia in children 1–10 years

1. Maxamaid products are generally intended for use in children 1–8 years
2. Maximum products are generally intended for use in children over 8 years and adults

TYR Anamix® Junior LQ (SHS)

Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 3.1 g, energy 500 kJ (119 kcal)/125 mL, with vitamins, minerals, and trace elements. Orange flavour, net price 36 x 125-mL bottle = £272.79

Nutritional supplement for the dietary management of tyrosinaemia type 1 (when nitisinone (NTBC) is used, see section 9.8.1), type II, and type III, in children over 1 year

TYR cooler® (Vitaflo)

Liquid, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 7 g, fat 50.6 mg, energy 386 kJ (92 kcal)/110 mL, with vitamins, minerals, and trace elements. Unflavoured (flavoured: see FlavourPac® sachets, p. 925), net price 30 x 25-g sachets = £271.89

Nutritional supplement for the dietary management of tyrosinaemia in children over 8 years and adults

TYR express® (Vitaflo)

Powder, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 3.8 g, fat less than 100 mg, energy 315 kJ (76 kcal)/25 g, with vitamins, minerals, and trace elements. Unflavoured (flavoured: see FlavourPac® sachets, p. 925), net price 30 x 20-g sachets = £151.93

Nutritional supplement for the dietary management of tyrosinaemia. Not recommended for children under 8 years

TYR Gel® (Vitaflo)

Gel, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 8.4 g, carbohydrate 8.6 g, fat less than 100 mg, energy 286 kJ (68 kcal)/20 g, with vitamins, minerals, and trace elements. Unflavoured (flavoured: see FlavourPac® sachets, p. 925), net price 30 x 25-g sachets = £271.89

Nutritional supplement for the dietary management of tyrosinaemia in children 1–10 years

XPEN TYR Maximum® (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 25 g, carbohydrate 51.8 g, fat less than 500 mg, energy 1511 kJ (368 kcal)/100 g, with vitamins, minerals, and trace elements. Flavours: orange, unflavoured (flavoured: see Modjul® Flavour System, p. 925), net price 500 g = £82.57

Nutritional supplement for the dietary management of tyrosinaemia in children 1–8 years

XPEN TYR Tyrosidon® (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured (flavoured: see Modjul® Flavour System, p. 925). Net price 500 g = £156.42

Nutritional supplement for the dietary management of tyrosinaemia in children and adults where plasma-methionine concentrations are normal

XPTM Tyrosidon® (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine, tyrosine, and methionine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Unflavoured (flavoured: see Modjul® Flavour System, p. 925). Net price 500 g = £156.42

Nutritional supplement for the dietary management of tyrosinaemia type 1 in children and adults where plasma-methionine concentrations are above normal

1. Urea cycle disorders (other than arginase deficiency)

L-Arginine (SHS)

Powder, net price 100 g = £12.27

Nutritional supplement for the dietary management of urea cycle disorders other than arginase deficiency, such as hyperammonaemia types I and II, citrullinaemia, arginosuccinic aciduria, and deficiency of N-acetyl glutamate synthase
Conditions for which ACBS products can be prescribed

**Birthmarks**  See Disfiguring skin lesions, below

**Dermatitis**  Aveeno® Bath Oil; Aveeno® Cream; Aveeno® Colloidal; Aveeno® Lotion; E45® Emollient Bath Oil; E45® Emollient Wash Cream; E45® Lotion

For details of preparations see section 13.2.1, p. 701

**Dermatitis herpetiformis**  See also Gluten-free foods, p. 925

**Disfiguring skin lesions (birthmarks, mutilating lesions, scars, vitiligo)**  Covermark® classic foundation and finishing powder; Dermacolor® Camouflage cream and fixing powder; Keromask® masking cream and finishing powder; Veil® Cover cream and Finishing Powder. (Cleansing Creams, Cleansing Milks, and Cleansing Lotions are excluded)

For details of preparations see section 13.8.2, p. 732

**Disinfectants (antiseptics)**  May be prescribed on an FP10 only when ordered in such quantities and with such directions as are appropriate for the treatment of patients, but not for general hygienic purposes.

**Dry mouth (xerostomia)**  For patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome.

AS Saliva Orthana®; Biotène Oralbalance®; BioXtra®; Glandosane®; Saliveze®, Salivix®.

For details of preparations see section 12.3.5, p. 698

**Eczema**  See Dermatitis, above

**Photodermatoses (skin protection in)**  Delph® Sun Lotion SPF 30; Sansense® Ultra; Uvistat® Lipscreen SPF 30; Uvistat® Suncream SPF 30 and 50.

For details of preparations see section 13.8.1, p. 730

**Pruritus**  See Dermatitis, above
Wound management

products and elasticated garments

A8.1 Basic wound contact dressings
A8.1.1 Low adherence dressings
A8.1.2 Absorbent dressings
A8.2 Advanced wound dressings
A8.2.1 Hydrogel dressings
A8.2.2 Vapour-permeable films and membranes
A8.2.3 Soft polymer dressings
A8.2.4 Hydrocolloid dressings
A8.2.5 Foam dressings
A8.2.6 Alginate dressings
A8.2.7 Capillary-action dressings
A8.2.8 Odour absorbent dressings
A8.3 Antimicrobial dressings
A8.3.1 Honey
A8.3.2 Iodine
A8.3.3 Silver
A8.3.4 Other antimicrobials
A8.4 Specialised dressings
A8.4.1 Protease-modulating matrix dressings
A8.4.2 Silicone keloid dressings
A8.5 Adjunct dressings and appliances
A8.5.1 Surgical absorbents
A8.5.2 Wound drainage pouches
A8.6 Complex adjunct therapies
A8.6.1 Topical negative pressure therapy
A8.7 Wound care accessories
A8.7.1 Dressing packs
A8.7.2 Woven and fabric swabs
A8.7.3 Surgical adhesive tapes
A8.7.4 Adhesive dressings
A8.7.5 Skin closure dressings
A8.8 Bandages
A8.8.1 Non-extensible bandages
A8.8.2 Light-weight conforming bandages
A8.8.3 Tubular bandages and garments
A8.8.4 Support bandages
A8.8.5 Adhesive bandages
A8.8.6 Cohesive bandages
A8.8.7 Compression bandages
A8.8.8 Multi-layer compression bandaging
A8.8.9 Medicated bandages
A8.9 Compression hosiery and garments
A8.9.1 Graduated compression hosiery
A8.9.2 Lymphoedema garments

Wound dressings

The correct dressing for wound management depends not only on the type of wound but also on the stage of the healing process. The principal stages of healing are:

- cleansing, removal of debris;
- granulation, vascularisation;
- epithelialisation.

The ideal dressing for moist wound healing needs to ensure that the wound remains:

- moist with exudate, but not macerated;
- free of clinical infection and excessive slough;
- free of toxic chemicals, particles or fibres;
- at the optimum temperature for healing;
- undisturbed by the need for frequent changes;
- at the optimum pH value.

Advanced wound dressings (section A8.2) are designed to control the environment for wound healing, for example to donate fluid (hydrogels), maintain hydration (hydrocolloids), or to absorb wound exudate (alginate, foams).
Practices such as the use of irritant cleansers and desloughing agents may be harmful and are largely obsolete; removal of debris and dressing remnants should need minimal irrigation with lukewarm sterile sodium chloride 0.9% solution or water. Hydrogel, hydrocolloid, and medical grade honey dressings can be used to deslough wounds by promoting autolytic debridement; there is insufficient evidence to support any particular method of debridement for difficult-to-heal surgical wounds. Sterile larvae (maggots) are also available for biosurgical removal of wound debris. There have been few clinical trials able to establish a clear advantage for any particular product. The choice between different dressings depends not only on the type and stage of the wound, but also on patient preference or tolerance, site of the wound, and cost. For further information, see Buyers’ Guide: Advanced wound dressings (October 2008), NHS Purchasing and Supply Agency, Centre for Evidence-based Purchasing. The table below gives suggestions for choices of primary dressing depending on the type of wound (a secondary dressing may be needed in some cases).

Note: In each section of this table the dressings are listed in order of increasing absorbency. Some wound contact (primary) dressings require a secondary dressing.
interfere with absorption; dressings with ‘normal loading’ (such as Jelonet®) have been used for skin graft transfer.

Knitted viscose primary dressing is an alternative to tulle dressings for exuding wounds; it can be used as the initial layer of multi-layer compression bandaging in the treatment of venous leg ulcers.

Knitted Viscose Primary Dressing, BP 1993
Warp knitted fabric manufactured from a bright viscose monofilament.
N-A Dressing*, 9.5 cm × 9.5 cm = 35p, 9.5 cm × 19 cm = 67p (Sytagenex)
N-A Ultra®, silicone-coated, 9.5 cm × 9.5 cm = 33p, 9.5 cm × 19 cm = 63p (Sytagenex)
Profore®, 14 cm × 20 cm = 30p (S&N Hlth.)
Tricotex®, 9.5 cm × 9.5 cm = 32p (S&N Hlth.)

Paraffin Gauze Dressing, BP 1993
(Tulle Gauze). Fabric of leno weave, wool and warf threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin, 10 cm × 10 cm, (light loading) = 25p; (normal loading) = 37p (most suppliers including Synergy Healthcare—Furnace® (light loading); BSN Medical—Cuticel® Classic (normal loading); S&N Hlth.—Jelonet® (normal loading); Neoemed—Neotulle® (normal loading); C D Medical—Paragauze® (normal loading))

Atrauman® (Hartmann)
Non-adherent knitted polyester primary dressing impregnated with neutral triglycerides, 5 cm × 5 cm = 24p, 7.5 cm × 10 cm = 26, 10 cm × 20 cm = 58, 20 cm × 30 cm = £1.58

A8.1.2 Absorbent dressings

Absorbent Perforated Plastic Film Faced Dressings
Low-adherence primary dressing consisting of three layers—perforated polyester film wound contact layer, absorbent cotton pad, and hydrophilic backing. Where no size specified by the prescriber, the 5 cm size to be supplied.

SkinCare® Pad, 5 cm × 5 cm = 13p, 10 cm × 10 cm = 20p, 10 cm × 20 cm = 40p (Braun)
Cutisorb® LA, 5 cm × 5 cm = 8p, 10 cm × 10 cm = 14p, 10 cm × 20 cm = 29p (BSN Medical)
Interpose®, 5 cm × 5 cm = 9p, 10 cm × 10 cm = 15p, 10 cm × 20 cm = 32p (Frontier)
Melolin®, 5 cm × 5 cm = 16p, 10 cm × 10 cm = 26p, 20 cm × 10 cm = 51p (S&N Hlth.)
Release®, 5 cm × 5 cm = 14p, 10 cm × 10 cm = 23p, 20 cm × 10 cm = 44p (Sytagenex)
Skinint®, 5 cm × 5 cm = 10p, 10 cm × 10 cm = 17p, 20 cm × 10 cm = 34p (Robinson)
Solvanne N®, 5 cm × 5 cm = 9p, 10 cm × 10 cm = 17p, 10 cm × 20 cm = 33p (Activa)
Telfa®, 5 cm × 7.5 cm = 12p, 10 cm × 7.5 cm = 15p, 15 cm × 7.5 cm = 17p, 20 cm × 7.5 cm = 25p (Covidien)

For moderately to heavily exuding wounds

Absorbent Cellulose Dressing with Fluid Repellent Backing

Eclipse®, 15 cm × 15 cm = 97p, 20 cm × 30 cm = £2.14, 60 cm × 40 cm = £8.15, 80 cm × 50 cm = £9.35, 60 cm × 70 cm (boot-shape) = £13.54 (Advancis)
Eux-Dry®, 10 cm × 15 cm = £1.06, 15 cm × 23 cm = £2.17, 23 cm × 38 cm = £5.04 (S&N Hlth.)
Mesorb®, cellulose wound pad with gauze wound contact layer and non-woven repellent backing, 10 cm × 10 cm = 59p, 10 cm × 15 cm = 77p, 20 cm × 20 cm = 95p, 15 cm × 20 cm = £1.36, 20 cm × 25 cm = £2.14, 20 cm × 30 cm = £2.43 (Molnlycke)
Telfa® Max®, 22.8 cm × 38 cm = £4.62, 38 cm × 45.7 cm = £5.61, 38 cm × 60.9 cm = £8.16 (Covidien)
Zetuvit®, E, non-stereile, 10 cm × 10 cm = 6p, 10 cm × 20 cm = 8p, 20 cm × 20 cm = 13p, 20 cm × 40 cm = 26p, sterile, 10 cm × 10 cm = 20p, 10 cm × 20 cm = 23p, 20 cm × 20 cm = 37p, 20 cm × 40 cm = £1.02 (Hartmann)

For heavily exuding wounds

Cutisorb® Ultra (BSN Medical)
Super absorbent cellulose and polymer primary dressing, 10 cm × 10 cm = £1.99, 20 cm × 20 cm = £6.25, 10 cm × 20 cm = £3.33, 20 cm × 30 cm = £9.42
DryMax® Extra (Aspen Medical)
Super absorbent cellulose and polymer primary dressing, 10 cm × 10 cm = £1.99, 20 cm × 20 cm = £6.16, 10 cm × 20 cm = £3.28, 20 cm × 30 cm = £8.86
KerraMax® (Ark Therapeutics)
Super absorbent polyacrylate primary dressing, 10 cm × 10 cm = 90p, 10 cm × 22 cm = £1.19, 20 cm × 22 cm = £2.10, 20 cm × 30 cm = £2.40
Zetuvit® Plus (Hartmann)
Super absorbent cellulose primary dressing, 10 cm × 10 cm = 60p, 10 cm × 20 cm = £3.83, 15 cm × 20 cm = 95p, 20 cm × 25 cm = £1.30, 20 cm × 40 cm = £2.00

Proguide® WCL (S&N Hlth.)
Super absorbent hydrocellular primary dressing, 10 cm × 10 cm = £2.05
A8.2 Advanced wound dressings

Advanced wound dressings can be used for both acute and chronic wounds. Categories for dressings in this section (A8.2) start with the least absorptive, moisture-donating hydrogel dressings, followed by increasingly more absorptive dressings. These dressings are classified according to their primary component; some dressings are comprised of several components.

A8.2.1 Hydrogel dressings

Hydrogel dressings are most commonly supplied as an amorphous, cohesive topical application that can take up the shape of a wound. A secondary, non-absorbent dressing is needed. These dressings are generally used to donate liquid to dry sloughy wounds and facilitate autolytic debridement of necrotic tissue; some also have the ability to absorb very small amounts of exudate. Hydrogel products that do not contain propylene glycol can be used if the wound is to be treated with larval therapy.

Hydrogel sheet dressings are best avoided in the presence of infection, and are unsuitable for heavily exuding wounds.

### Hydrogel sheet dressings

- **ActiFormCool** (Activa)
  - Hydrogel dressing, 5 cm x 5 cm = £1.70
  - Hydrogel dressing, 10 cm x 10 cm = £2.49
  - Hydrogel dressing, 20 cm x 20 cm = £7.51

- **AquaFlo** (Covidien)
  - Hydrogel dressing, 7.5 cm diameter = £2.55

- **Gel FX** (Synergy Healthcare)
  - Hydrogel dressing (without adhesive border) 10 cm x 10 cm = £1.60

- **Geliperm** (Geistlich)
  - Hydrogel sheets, 10 cm x 10 cm = £2.45

- **Hydrosorb** (Hartmann)
  - Absorbent, transparent, hydrogel sheets containing polyurethane polymers coated with a semi-permeable film, 5 cm x 7.5 cm = £1.46
  - Hydrogel dressing, 10 cm x 10 cm = £2.09

- **Intrasite Conformable** (S&N Hlth.)
  - Soft non-woven dressing impregnated with *Intrasite* gel, 10 cm x 10 cm = £1.70

- **Novogel** (Ford)
  - Hydrogel-containing guar gum and propylene glycol, 15 g = £1.39

**A8.2.2 Vapour-permeable films and membranes**

Vapour-permeable films and membranes allow the passage of water vapour and oxygen but are impermeable to water and micro-organisms, and are suitable for lightly exuding wounds. They are highly conformable, provide protection, and a moist healing environment; vapour-permeable films and membranes permit constant observation of the wound. Water vapour loss can occur at a slower rate than exudate is generated, so that fluid accumulates under the dressing, which can lead to tissue maceration and to wrinkling at the adhesive contact site (with risk of bacterial entry). Newer versions of these dressings have increased moisture vapour permeability. Despite these advances, vapour-permeable films and membranes are unsuitable for infected, large heavily exuding wounds, and chronic leg ulcers.

Vapour-permeable films and membranes are suitable for partial-thickness wounds with minimal exudate, or wounds with eschar. Most commonly, they are used as a secondary dressing over alginates or hydrols; film dressings can also be used to protect the fragile skin of patients at risk of developing minor skin damage caused by friction or pressure.

### Vapour-permeable Adhesive Film Dressing (Semi-permeable Adhesive Dressing)

Extensible, waterproof, water-vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces.

- **ActivHeal Film** (MedLogic)
  - Film dressing, 6 cm x 7 cm = £2.09

- **Askina Derm** (Braun)
  - Film dressing, 6 cm x 7 cm = £2.09

- **Bioclusive** (Systagenix)
  - Film dressing, 10 cm x 12.7 cm = £1.54

### Wound contact dressings

Dressings with soft polymer, often a soft silicone polymer, in a non-adherent or gently adherent layer are suitable for use on lightly to moderately exuding wounds. For moderately to heavily exuding wounds, an absorbent secondary dressing can be added, or a soft polymer dressing with an absorbent pad can be used.

Wound contact dressings coated with soft silicone have gentle adhesive properties and can be used on fragile skin areas or where it is beneficial to reduce the frequency of primary dressing changes.
Appendix B: Wound management

940 A8.2.4 Hydrocolloid dressings

Hydrocolloid dressings are usually presented as a hydrocolloid layer on a vapour-permeable film or foam pad. Semi-permeable to water vapour and oxygen, these dressings form a gel in the presence of exudate to facilitate rehydration in lightly to moderately exuding wounds and promote autolytic debridement of dry, sloughy, or necrotic wounds; they are also suitable for promoting granulation.

Hydrocolloid-fibrous dressings made from modified carboxymethyl cellulose fibres resemble alginate dressings; hydrocolloid dressings form a gel in the presence of exudate to absorb fluid; hydrocolloid-fibrous dressings are more absorptive and suitable for lightly to moderately exuding wounds.

Without absorbent pad

Soft polymer dressings should not be used on heavily bleeding wounds; blood clots can cause the dressing to adhere to the wound surface.

For silicone keloid dressings see section A8.4.2.

Hydrocolloid dressing with absorbent wound contact pad, 10 cm × 10 cm = £2.28, thin, 7.5 cm × 7.5 cm = £6.5p, 10 cm × 10 cm = £1.07, 15 cm × 15 cm = £2.42

NU DERM® (Systagenix)
Semi-permeable hydrocolloid dressing, 5 cm × 5 cm = 85p, 10 cm × 10 cm = £1.56, 15 cm × 15 cm = £3.18, 20 cm × 20 cm = £6.36, 8 cm × 12 cm (heel/elbow) = £3.18, 15 cm × 18 cm (sacral) = £4.45, thin, 10 cm × 10 cm = £1.06

Tegaderm® Hydrocolloid (3M)
Hydrocolloid dressing without adhesive border, 10 cm × 10 cm = £2.30, 15 cm × 15 cm = £4.46; thin, semi-permeable, clear film dressing with hydrocolloid, 10 cm × 10 cm = £1.51

Ultrec Pro® (Covidien)
Semi-permeable hydrocolloid dressing, without adhesive border 10 cm × 10 cm = £2.23, 15 cm × 15 cm = £4.36, 20 cm × 20 cm = £6.56

Tegaderm® Hydrocolloid (3M)
Hydrocolloid dressing with adhesive border, 10 cm × 12 cm (oval) = £2.26, 13 cm × 15 cm (oval) = £4.22, 17.1 cm × 16.1 cm (sacral) = £4.71; thin, semi-permeable, clear film dressing with hydrocolloid, 10 cm × 12 cm (oval) = £1.50, 13 cm × 15 cm (oval) = £2.81

Ultec Pro® (Covidien)
Semi-permeable hydrocolloid dressing with adhesive border, 21 cm × 21 cm = £4.58, 15 cm × 18 cm (sacral) = £3.23, 19.5 cm × 23 cm (sacral) = £4.88

Hydrocolloid-fibrous dressings
Aquadex® (Convatec)
Soft non-woven pad containing hydrocolloid-fibres, 4 cm × 10 cm = £1.40, 4 cm × 20 cm = £2.07, 4 cm × 30 cm = £3.11, 5 cm × 5 cm = £1.10, 10 cm × 10 cm = £2.81, 15 cm × 15 cm = £4.91; 2 cm × 45 cm (ribbon) = £2.64

Versiva® XC (Convatec)
Hydrocolloid gelling foam dressing, without adhesive border, 7.5 cm × 7.5 cm = £1.39, 11 cm × 11 cm = £2.31, 15 cm × 15 cm = £4.26, 20 cm × 20 cm = £8.37, with adhesive border, 10 cm × 10 cm = £2.36, 14 cm × 14 cm = £3.19, 19 cm × 19 cm = £5.09, 22 cm × 22 cm = £5.85, 18.5 cm × 20.5 cm (heel) = £5.65, 21 cm × 25 cm (sacral) = £6.06

Polyurethane matrix dressing
Cutinova® Hydro (SNH Ltd.)
Polyurethane matrix with absorbent particles and waterproof polyurethane film, 5 cm × 6 cm = £1.19, 10 cm × 10 cm = £2.40, 15 cm × 20 cm = £5.07

A8.2.5 Foam dressings

Dressings containing hydrophilic polyurethane foam (adhesive or non-adhesive), or without plastic film-backing, are suitable for all types of exuding wounds, but not for dry wounds; some foam dressings have a moisture-sensitive film backing with variable permeability dependant on the level of exudate.

Foam dressings vary in their ability to absorb exudate; some are suitable only for lightly to moderately exuding wounds, others have greater fluid-handling capacity and are suitable for heavily exuding wounds. Saturated foam dressings can cause maceration of healthy skin if left in contact with the wound.

Foam dressings can be used in combination with other primary wound contact dressings. If used under compression bandaging or compression garments, the fluid-handling capacity of the foam dressing may be reduced. Foam dressings can also be used to provide a protective cushion for fragile skin.

For lightly exuding wounds
Polyurethane Foam Film Dressing with Adhesive Border
PolyMem®, 5 cm × 5 cm = 48p (Aspen Medical)

Tielle® Lite, 11 cm × 11 cm = £2.28; 7 cm × 9 cm = £1.21; 8 cm × 15 cm = £2.81; 8 cm × 20 cm = £2.97 (Systagenix)

For lightly to moderately exuding wounds
PolyLite® Foam Dressing, BP 1993
Lyfoam®, 7.5 cm × 7.5 cm = £1.05, 10 cm × 10 cm = £1.20, 10 cm × 17.5 cm = £1.94, 15 cm × 20 cm = £2.61 (Molnlycke)

Suprasorb® M, 10 cm × 10 cm = £1.78, 10 cm × 20 cm = £3.14, 20 cm × 20 cm = £5.23 (Activa)

Polyurethane Foam Film Dressing with Adhesive Border
Suprasorb® P, 7.5 cm × 7.5 cm = £1.20, 10 cm × 10 cm = £1.29, 15 cm × 15 cm = £2.32 (Activa)
Appendix 8: Wound management

**Polyurethane Foam Dressing without Adhesive Border**

**Acticoat FlexiPore**, self-adhesive, 6 cm x 7 cm = £9.45, 10 cm x 10 cm = £11.77, 15 cm x 10 cm = £22.55, 20 cm x 20 cm = £34.51, 30 cm x 30 cm = £63.13 (MediLogic)

**Allevyn**

9 cm diameter = £1.50, 10 cm diameter = £2.29, 12.5 cm diameter = £3.35 (S&N Hlth.)

**Allevyn Thin**

9 cm diameter = £1.00, 10 cm diameter = £2.03, 15 cm diameter = £3.35, 15 cm x 20 cm = £4.06 (S&N Hlth.)

**Suprasorb P**

5 cm x 5 cm = £9.35, 7.5 cm x 7.5 cm = £9.95, 10 cm x 10 cm = £11.15, 15 cm x 15 cm = £13.12 (Activa)

**Transolent**, self-adhesive, 5 cm x 7 cm = £1.01, 10 cm x 10 cm = £1.19, 15 cm x 15 cm = £2.70, 20 cm x 20 cm = £5.59 (Braun)

**UrgoCell TLC**

Self-adherent, 6 cm x 6 cm = £1.74, 10 cm x 10 cm = £2.53, 15 cm x 20 cm = £4.57, 12 cm x 19 cm (heal) = £4.52 (Urko)

For moderately to heavily exuding wounds

**Polyurethane Foam Dressing**

**Copa**

5 cm x 5 cm = £7.00, 7.5 cm x 7.5 cm = £7.82, 10 cm x 10 cm = £11.60, 12.5 cm x 12.5 cm = £16.85, 15 cm x 17.5 cm = £23.25, 20 cm x 20 cm = £44.12 (MediLogic)

**CUTMED**

Cavity, 6 cm x 4 cm = £1.74, 10 cm x 10 cm = £2.89, 15 cm x 2 cm = £6.11, 15 cm x 15 cm = £4.34 (BSN Medical)

**Polyurethane Foam Dressing with Adhesive Border**

**Acticoat Foam Island**, 7.5 cm x 7.5 cm = £1.18, 10 cm x 10 cm = £1.60, 12.5 cm x 12.5 cm = £2.68, 15 cm x 15 cm = £3.12, 20 cm x 20 cm = £5.47 (S&N Hlth.)

7.5 cm x 7.5 cm = £1.43, 10 cm x 10 cm = £2.10, 12.5 cm x 12.5 cm = £2.57, 17.5 cm x 17.5 cm = £5.07, 17.5 cm x 22.5 cm = £4.80, 22.5 cm x 22.5 cm = £8.38 (sacral) 17 cm x 17 cm = £8.60, 22 cm x 22 cm = £10.77 (S&N Hlth.)

**Allevyn Plus Adhesive**

12.5 cm x 12.5 cm = £3.16, 17.5 cm x 17.5 cm = £6.10, 12.5 cm x 22.5 cm = £5.60, 15 cm x 22.5 cm = £5.27, 17 cm x 17 cm = £4.61, 22 cm x 22 cm = £6.67 (S&N Hlth.)

**Biatain Adhesive**

10 cm x 10 cm = £6.15, 12.5 cm x 12.5 cm = £6.41, 18 cm x 18 cm = £4.86, 18 cm x 28 cm = £7.20, 22 cm x 23 cm (sacral) = £4.16, 19 cm x 20 cm (heel) = £4.85, 17 cm diameter (contour) = £4.67 (Coloplast)

**Biatain Silicone**

7.5 cm x 7.5 cm = £1.41, 10 cm x 10 cm = £2.27, 12.5 cm x 12.5 cm = £2.90, 15 cm x 15 cm = £3.98, 17.5 cm x 17.5 cm = £5.49 (Coloplast)

**Copa Island**

10 cm x 10 cm = £1.51, 15 cm x 15 cm = £2.84, 20 cm x 20 cm = £3.56 (Covidien)

**PermaFoam**

16.5 cm x 18 cm (concave) = £1.76, 18 cm x 18 cm (sacral) = £3.99, 22 cm x 22 cm (sacral) = £5.55, 25 cm x 25 cm (sacral) = £9.65, 30 cm x 30 cm = £18.42 (Activa)

**PermaFoam Comfor**

8 cm x 8 cm = £1.04, 10 cm x 20 cm = £3.13, 11 cm x 11 cm = £1.98, 15 cm x 15 cm = £3.23, 20 cm x 20 cm = £4.69 (Hartmann)

**PolyMem**

5 cm x 7 cm = £1.10, 8.8 cm x 12.7 cm = £1.95, 10 cm x 13 cm = £2.08, 15 cm x 15 cm = £2.80, 16.5 cm x 20.9 cm = £6.62, 18.4 cm x 20 cm (sacral) = £4.32 (Aspen Medical)

**Tegaderm**

24 cm x 12 cm = £2.39, 15 cm x 15 cm = £3.82, 20 cm x 20 cm = £5.01, 30 cm x 30 cm = £7.20, 45 cm x 45 cm = £10.02 (3M)

**Allevyn Plus Borderless**

11 cm x 11 cm = £3.04, 15 cm x 15 cm = £5.51 (Systagenix)

**Allevyn Xtra**

11 cm x 11 cm = £2.24, 15 cm x 15 cm = £3.37, 15 cm x 20 cm = £5.51 (Systagenix)

**Trufoam NA**

5 cm x 5 cm = £1.09, 10 cm x 10 cm = £2.07, 15 cm x 15 cm = £3.81 (Aspen Medical)

**Cavi-Care**

Soft, conforming cavity wound dressing prepared by mixing thoroughly for 15 seconds immediately before use and allowing to expand its volume within the cavity: 29 g = £18.62

---

**Alginite dressings**

Non-woven or fibrous, non-occlusive, alginite dressings: made from calcium alginate, or calcium sodium alginate, derived from brown seaweed, form a soft gel in contact with wound exudate.

Alginite dressings are highly absorbent and suitable for use on exuding wounds, and for the promotion of

---

**Trufoam**

11 cm x 11 cm = £2.18, 15 cm x 15 cm = £3.64, 7 cm x 9 cm = £1.14, 15 cm x 20 cm = £4.57 (Aspen Medical)

**BNF 61**
autolytic debridement of debris in very moist wounds. Alginate dressings also act as a haemostatic, but caution is needed because blood clots can cause the dressing to adhere to the wound surface. Alginate dressings should not be used if bleeding is heavy and extreme caution is needed if used for tumours with friable tissue. Alginate sheets are suitable for use as a wound contact dressing for moderately to heavily exuding wounds and can be layered into deep wounds; alginate rope can be used in sinus and cavity wounds to improve absorption of exudate and prevent maceration. If the dressing does not have an adhesive border or integral adhesive plastic film backing, a secondary dressing will be required.

**ActivHeal®** (MedLogic®)
- **ActivHeal Alginate**, calcium sodium alginate dressing, 5 cm × 5 cm = £5.85, 10 cm × 10 cm = £11.13, 10 cm × 20 cm = £27.78, cavity dressing, 2 cm × 30 cm = £2.09

**Algostier M** (S&N Hlth.)
- Calcium alginate fibre, non-woven, 5 cm × 5 cm = £7.87, 10 cm × 10 cm = £11.80, 15 cm × 20 cm = £48.94, cavity dressing, 2 cm × 30 cm = £3.27

**Algostier P** (S&N Hlth.)
- Calcium alginate dressing, 5 cm × 5 cm = £8.97, 10 cm × 10 cm = £14.83, 10 cm × 20 cm = £24.71, 10 cm × 20 cm = £24.71, 10 cm × 20 cm = £29.43, 15 cm × 25 cm = £5.15, 30 cm × 61 cm = £27.03, cavity dressing, 30 cm × £2.84, 61 cm × £4.98, 91 cm × £5.96

**Curasorb Plus** (Protex)
- Calcium alginate dressing, 10 cm × 10 cm = £0.84

**Curasorb Zn**
- Calcium alginate and zinc dressing, 5 cm × 5 cm = £8.09, 10 cm × 10 cm = £11.68, 10 cm × 20 cm = £32.30

**Kaltostat®** (Convatec)
- Calcium alginate fibre, non-woven, 5 cm × 5 cm = £9.09, 7.5 cm × 12 cm = £1.96, 10 cm × 20 cm = £3.84, 15 cm × 25 cm = £6.61, cavity dressing, 2 g × £3.60

**Melgisorb®** (Mölnlycke)
- Calcium sodium alginate fibre, highly absorbent, gelling dressing, non-woven, 5 cm × 5 cm = 86p, 10 cm × 10 cm = £1.79, 10 cm × 20 cm = £3.36, cavity dressing, 32 cm × 2.2 cm, (2 g) = £3.39

**SeaSorb® Soft** (Coloplast)
- Alginate and carboxymethylcellulose dressing, highly absorbent, dressing, gelling dressing, 5 cm × 5 cm = £9.09, 10 cm × 10 cm = £12.18, 15 cm × 15 cm = £4.13, gelling filler, 44 cm = £2.57

**Sorbalgan®** (Hartmann)
- Calcium alginate dressing, 5 cm × 5 cm = £7.60, 10 cm × 10 cm = £11.59, Sorbalgon® T, cavity dressing, 2 g, 30 cm = £3.24

**SorbSan® Flat** (Aspen Medical)
- Calcium alginate fibre, highly absorbent, flat non-woven pads, 5 cm × 5 cm = £7.99, 10 cm × 10 cm = £11.66, 10 cm × 20 cm = £3.10

**SorbSan® Plus**
- Alginate dressing bonded to a secondary absorbent viscose pad, 7.5 cm × 10 cm = £1.67, 10 cm × 15 cm = £2.96, 10 cm × 20 cm = £3.73, 15 cm × 20 cm = £5.24

**SorbSan® Plus SA**
- Alginate dressing with adhesive border and absorbent backing, 11.5 cm × 14 cm = £2.92, 14 cm × 19 cm = £4.25, 14 cm × 24 cm = £5.14, 19 cm × 24 cm = £6.65

**SorbSan® Ribbon**
- 40 cm (with probe) = £2.01

**SorbSan® Surgical Packing**
- 30 cm (2 g, with probe) = £3.41

**Suprasorb® A** (Activa)
- Calcium alginate dressing, 5 cm × 5 cm = 58p, 10 cm × 10 cm = £1.14, cavity dressing, 30 cm (2 g) = £2.11

**Tegaderm® Alginate** (3M)
- Calcium alginate dressing, 5 cm × 5 cm = 77p, 10 cm × 10 cm = £1.62, cavity dressing, 2 cm × 30 cm × £2.70

**Urgosorb®** (Utgo)
- Alginate and carboxymethylcellulose dressing without adhesive border, 5 cm × 5 cm = 83p, 10 cm × 10 cm = £1.99, 10 cm × 20 cm = £3.64, cavity dressing, 30 cm = £2.65

---

**A8.2.7 Capillary-action dressings**

Capillary-action dressings consist of an absorbent core of hydrophilic fibres sandwiched between two low-adherent wound-contact layers to ensure no fibres are shed on to the wound surface. Wound exudate is taken up by the dressing and retained within the highly absorbent central layer.

The dressing may be applied intact to relatively superficial areas, but for deeper wounds or cavities it may be cut to shape to ensure good contact with the wound base. Multiple layers may be applied to heavily exuding wounds to further increase the fluid-absorbing capacity of the dressing. A secondary adhesive dressing is necessary.

Capillary-action dressings are suitable for use on all types of exuding wounds, but particularly on sloughy wounds where removal of fluid from the wound aids debridement; capillary-action dressings are contra-indicated for heavily bleeding wounds or arterial bleeding.

**Advadraw®** (Advancis)
- Non-adherent dressing consisting of a soft viscose and polyester absorbent pad with central wicking layer between two perforated permeable wound contact layers. 5 cm × 7.5 cm = 56p, 10 cm × 10 cm = 87p, 10 cm × 15 cm = £1.17, 15 cm × 20 cm = £1.54

**Advadraw Spiral®,** 0.5 cm × 40 cm = 81p

**Cerdak® Basic** (CliniMed)
- Non-adhesive wound contact sachet containing ceramic spheres, 5 cm × 5 cm = 70p, 10 cm × 10 cm = £1.56, 10 cm × 15 cm = £2.08, cavity dressing, 10 cm × 10 cm = £2.10, 10 cm × 15 cm = £2.63

**Cerdak® Aerocloth**, non-adhesive wound contact sachet containing ceramic spheres, with non-woven fabric adhesive backing, 5 cm × 5 cm = £1.37, 5 cm × 10 cm = £1.94

**Cerdak® Aerofilm**, non-adhesive wound contact sachet containing ceramic spheres, with waterproof transparent adhesive film backing, 5 cm × 5 cm = £1.51, 5 cm × 10 cm = £2.07

**Sumar® Lite**, for light to moderately exuding wounds and cavities, 5 cm × 5 cm = 93p, 10 cm × 10 cm = £1.59, 10 cm × 15 cm = £2.12

**Sumar® Max**, for heavily exuding wounds, 5 cm × 5 cm = 95p, 10 cm × 10 cm = £1.61, 10 cm × 15 cm = £2.15

**Sumar® Spiral**, 0.5 cm × 40 cm = £1.57

**Vacutex®** (Protex)
- Low-adherent dressing consisting of two external polyester wound contact layers with central wicking polyester/cotton mix absorbent layer. 5 cm × 5 cm = 94p, 10 cm × 10 cm = £1.66, 10 cm × 15 cm = £2.23, 20 cm × 20 cm = £2.68, 15 cm × 20 cm = £3.14, 20 cm × 20 cm = £4.28
A8.2.8 Odour absorbent dressings

Dressings containing activated charcoal are used to absorb odour from wounds. The underlying cause of wound odour should be identified. Wound odour is most effectively reduced by debriding of slough, reduction in bacterial levels, and frequent dressing changes. Fungating wounds and chronic infected wounds produce high volumes of exudate which can reduce the effectiveness of odour absorbent dressings. Many odour absorbent dressings are intended for use in combination with other dressings; odour absorbent dressings with a suitable wound contact layer can be used as a primary dressing.

A8.3.1 Honey

Medical grade honey has antimicrobial and anti-inflammatory properties and can be used for acute or chronic wounds. Medical grade honey has osmotic properties, producing an environment that promotes autolytic debridement; it can help control wound malodour. Honey dressings should not be used on patients with extreme sensitivity to honey, bee stings or bee products. Patients with diabetes should be monitored for changes in blood-glucose concentrations during treatment with topical honey or honey-impregnated dressings.

A8.2.8 Odour absorbent dressings

Dressings containing activated charcoal are used to absorb odour from wounds. The underlying cause of wound odour should be identified. Wound odour is most effectively reduced by debriding of slough, reduction in bacterial levels, and frequent dressing changes. Fungating wounds and chronic infected wounds produce high volumes of exudate which can reduce the effectiveness of odour absorbent dressings. Many odour absorbent dressings are intended for use in combination with other dressings; odour absorbent dressings with a suitable wound contact layer can be used as a primary dressing.

A8.3 Antimicrobial dressings

Spreading infection at the wound site requires treatment with systemic antibacterials. For local wound infection, a topical antimicrobial dressing can be used to reduce the level of bacteria at the wound surface but will not eliminate a spreading infection. Some dressings are designed to release the antimicrobial into the wound, others act upon the bacteria after absorption from the wound. The amount of exudate present and the level of infection should be taken into account when selecting an antimicrobial dressing.

Medical grade honey (section A8.3.1), has antimicrobial and anti-inflammatory properties. Dressings impregnated with iodine (section A8.3.2), can be used to treat clinically infected wounds. Dressings containing silver (section A8.3.3), should be used only when clinical signs or symptoms of infection are present.

Dressings containing other antimicrobials (section A8.3.4) such as polihexanide (polyhexamethylene biguanide) or dialkylcarbamoyl chloride are available for use on infected wounds. Although hypersensitivity is unlikely with chlorhexidine impregnated tulle dressing, the antibacterial efficacy of these dressings has not been established.

A8.3.1 Honey

Medical grade honey has antimicrobial and anti-inflammatory properties and can be used for acute or chronic wounds. Medical grade honey has osmotic properties, producing an environment that promotes autolytic debridement; it can help control wound malodour. **Medical grade honey has antimicrobial and anti-inflammatory properties and can be used for acute or chronic wounds. Medical grade honey has osmotic properties, producing an environment that promotes autolytic debridement; it can help control wound malodour. Honey dressings should not be used on patients with extreme sensitivity to honey, bee stings or bee products. Patients with diabetes should be monitored for changes in blood-glucose concentrations during treatment with topical honey or honey-impregnated dressings.**
**Oxyzyme**

**Iodozyme**

**Iodosorb**

**Iodoflex**

from large wounds or with prolonged use. Systemic absorption of iodine may occur, particularly in wound exudate. of antimicrobial activity but it is rapidly deactivated by oxidase and iodide ions generate a low level of free iodine in the presence of moisture and oxygen. Two-component hydrogel dressings containing glucose oxidase and iodide ions generate a low level of free iodine when exposed to wound exudate. The free iodine acts as an antiseptic on the wound surface, the cadexomer absorbs wound exudate and encourages de-sloughing. Povidone–iodine fabric dressing iodine in the presence of moisture and oxygen. oxidase and iodide ions generate a low level of free iodine. Cadexomer–iodine

*Uses*

Antimicrobial dressings containing silver should be used only when infection is suspected as a result of clinical signs or symptoms (see also p. 944). Silver ions exert an antimicrobial effect in the presence of wound exudate; the volume of wound exudate as well as the presence of infection should be considered when selecting a silver-containing dressing. Silver-impregnated dressings should not be used routinely for the management of uncomplicated ulcers. It is recommended that these dressings should not be used on acute wounds as there is some evidence to suggest they delay wound healing. Dressings impregnated with silver sulfadiazine have broad antimicrobial activity; if silver sulfadiazine is applied to large areas, or used for prolonged periods, there is a risk of blood disorders and skin discoloration (see section 13.10.1.1). The use of silver sulfadiazine-impregnated dressings is contra-indicated in neonates, in pregnancy, and in patients with significant renal or hepatic impairment, sensitivity to sulphonamides, or G6PD deficiency. Large amounts of silver sulfadiazine applied topically may interact with other drugs—see Appendix 1 (sulphonamides).

#### Low adherence dressings

**Acticoat** (S&N Hlth.)

Three-layer antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 3-day wear), 5 cm × 5 cm = £3.30, 10 cm × 10 cm = £8.07, 10 cm × 20 cm = £12.62, 20 cm × 40 cm = £43.19.

**Acticoat** 7 three-layer antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 7-day wear), 5 cm × 5 cm = £5.74, 10 cm × 12.5 cm = £17.11, 15 cm × 15 cm = £30.76.

**Acticoat** Flex 3, conformable antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 3-day wear), 5 cm × 5 cm = £3.28, 10 cm × 10 cm = £8.01, 10 cm × 20 cm = £12.52, 20 cm × 40 cm = £42.85.

**Acticoat** Flex 7, conformable antimicrobial barrier dressing consisting of a polyester core between low adherent silver-coated high density polyethylene mesh (for 7-day wear), 5 cm × 5 cm = £5.70, 15 cm × 15 cm = £30.53, 10 cm × 12.5 cm = £16.98.

**Atrauman® Ag** (Hartmann)

Non-adherent polyamide fabric impregnated with silver and neutral triglycerides, 5 cm × 5 cm = £4.7p, 10 cm × 10 cm = £1.15, 10 cm × 20 cm = £2.25.

#### With charcoal

**Actisorb® Silver 220** (Sytogenesis)

Knitted fabric of activated charcoal, with one-way stretch, with silver residues, within spun-bonded nylon sleeve. 6.5 cm × 9.5 cm = £1.64, 10.5 cm × 10.5 cm = £2.58, 10.5 cm × 19 cm = £4.70.
Appendix 8: Wound management

### Soft polymer dressings

**Allevyn® Ag Gentle** (S&N Hlth.)
Soft polymer wound contact dressing, with silver sulfadiazine impregnated polyurethane foam layer, with adhesive border, 7.5 cm × 7.5 cm = £3.99, 10 cm × 10 cm = £5.99, 12.5 cm × 12.5 cm = £7.71, 17.5 cm × 17.5 cm = £14.69, without adhesive border, 5 cm × 5 cm = £3.12, 10 cm × 10 cm = £5.82, 10 cm × 20 cm = £9.62, 15 cm × 15 cm = £10.83, 20 cm × 20 cm = £16.04. (see notes above)

**Contra-indications**

See notes above

**Biaplex® Ag** (Mölnlycke)
Soft silicone wound contact dressing with polyurethane foam film backing, with silver, 10 cm × 10 cm = £5.85, 10 cm × 20 cm = £9.64, 15 cm × 15 cm = £10.85, 20 cm × 20 cm = £16.08, 20 cm × 50 cm = £20.17

**Urgotul® Silver** (Urgo)
Non-adherent soft polymer wound contact dressing, with silver, 10 cm × 12 cm = £3.34, 15 cm × 20 cm = £9.09

**Urgotul® Duo Silver** (Urgo)
Non-adherent, soft polymer wound contact dressing, with silver, 5 cm × 7 cm = £1.95, 11 cm × 11 cm = £3.87, 15 cm × 20 cm = £9.35

**Urgotul® SS** (Urgo)
Non-adherent, soft polymer wound contact dressing, with silver sulfadiazine, 11 cm × 11 cm = £2.99, 16 cm × 21 cm = £8.46

**Contra-indications**

See notes above

### Hydrocolloid dressings

**Aquacel® Ag** (Convatec)
Soft non-woven pad containing hydrocolloid fibres, (silver impregnated), 4 cm × 10 cm = £2.70, 4 cm × 20 cm = £5.27, 5 cm × 5 cm = £1.86, 10 cm × 10 cm = £4.44, 15 cm × 15 cm = £8.36, 20 cm × 20 cm = £20.73, 2 cm × 45 cm (ribbon) = £4.46

**Biatain® Ag Hydrocolloid** (Coloplast)
Semi-permeable, antimicrobial barrier dressing with silver (silver sodium thiosulphate), 10 cm × 10 cm = £6.72, 15 cm × 15 cm = £13.44

**Physiostick® Ag** (Coloplast)
Non-adherent polyester fabric with hydrocolloid and silver sulfadiazine, 10 cm × 10 cm = £2.14

**Contra-indications**

See notes above

### Foam dressings

**Acticoat® Moisture Control** (S&N Hlth.)
Three layer polyurethane dressing consisting of a silver coated layer, a foam layer, and a waterproof layer, 5 cm × 5 cm = £5.76, 10 cm × 10 cm = £15.82, 10 cm × 20 cm = £30.82

**Allevyn® Ag** (S&N Hlth.)
Silver sulfadiazine impregnated polyurethane foam film dressing with adhesive border, 7.5 cm × 7.5 cm = £3.24, 10 cm × 10 cm = £3.10, 12.5 cm × 12.5 cm = £6.70, 17.5 cm × 17.5 cm = £12.89, 17 cm × 17 cm (sacral) = £10.06, 22 cm × 22 cm (sacral) = £13.48, without adhesive border, 5 cm × 5 cm = £3.02, 10 cm × 10 cm = £5.69, 15 cm × 15 cm = £10.79, 20 cm × 20 cm = £15.81, 10.5 cm × 13.5 cm (heel) = £9.97

**Contra-indications**

See notes above

**Biatain® Ag** (Coloplast)
Silver impregnated polyurethane foam film dressing with adhesive border, 12.5 cm × 12.5 cm = £8.71, 18 cm × 18 cm = £17.47, 19 cm × 20 cm (heel) = £17.23, 23 cm × 23 cm (sacral) = £18.31, without adhesive border, 10 cm × 10 cm = £7.61, 5 cm × 7 cm = £3.13, 10 cm × 20 cm = £13.99, 15 cm × 15 cm = £15.28, 20 cm × 20 cm = £21.55, 5 cm × 6 cm (cavity) = £3.79

**PolyMem® Silver** (Aspen Medical)
Silver impregnated polyurethane foam film dressing, with adhesive border, 5 cm × 7.6 cm (oval) = £1.27, 12.7 cm × 8.8 cm (oval) = £5.34, without adhesive border, 10.8 cm × 10.8 cm = £8.45, 17.1 cm × 19 cm = £16.93, 8 cm × 8 cm (cavity) = £8.72

**UrgoCell® Silver** (Urgo)
Non-adherent, polyurethane foam film dressing with silver in wound contact layer, 6 cm × 6 cm = £4.11, 10 cm × 10 cm = £5.65, 15 cm × 20 cm = £10.17

### Alginate dressings

**Acticoat® Absorbent** (S&N Hlth.)
Calcium alginate dressing with a silver coated antimicrobial barrier, 5 cm × 5 cm = £5.04, 10 cm × 12.5 cm = £12.11, 2 cm × 30 cm (cavity) = £12.18

**Algiscite® Ag** (S&N Hlth.)
Calcium alginate dressing, with silver, 5 cm × 5 cm = £1.54, 10 cm × 10 cm = £3.85, 10 cm × 20 cm = £7.09, 2 g, 30 cm (cavity) = £5.32

**Melgisorb® Ag** (Mölnlycke)
Alginate and carboxymethylcellulose dressing, with silver, 5 cm × 5 cm = £3.43, 15 cm × 15 cm = £7.25, 3 cm × 44 cm (cavity) = £4.32

**Seasorb® Ag** (Coloplast)
Alginate and carboxymethylcellulose dressing, with silver, 5 cm × 5 cm = £1.53, 10 cm × 10 cm = £3.74, 15 cm × 15 cm = £6.12, 3 cm × 44 cm (cavity) = £4.05

**Silvercel®** (Systagenix)
Alginate and carboxymethylcellulose dressing impregnated with silver, 2.5 cm × 30.5 cm = £4.45, 5 cm × 5 cm = £1.68, 10 cm × 20 cm = £6.78, 11 cm × 11 cm = £4.14

**Silvercel® Non-adherent**
Alginate and carboxymethylcellulose dressing with film wound contact layer, impregnated with silver, 5 cm × 5 cm = £1.80, 11 cm × 11 cm = £4.32, 10 cm × 20 cm = £8.05, 2.5 cm × 30.5 cm (cavity) = £4.37

**Sorbasan® Silver** (Aspen Medical)
Alginate Ag, calcium alginate fibre, highly absorbent, flat non-woven pads, with silver, 5 cm × 5 cm = £1.54, 10 cm × 10 cm = £3.91, 10 cm × 20 cm = £7.13

**Sorbasan® Silver Plus, Calcium alginate dressing with absorbent backing, with silver, 7.5 cm × 10 cm = £3.25, 10 cm × 15 cm = £5.41, 10 cm × 20 cm = £6.58, 15 cm × 20 cm = £8.82

**Sorbasan® Silver Plus SA**, calcium alginate dressing with absorbent backing and adhesive dressing, with silver, 11.5 cm × 14 cm = £5.28, 14 cm × 19 cm = £7.60, 14 cm × 24 cm = £8.36, 19 cm × 24 cm = £9.32

**Sorbasan® Silver Ribbon**, with silver, 40 cm (with probe) = £4.08

**Sorbasan® Silver Surgical Packing**, with silver, 30 cm (2 g, with probe) = £5.55

**Suprasorb® A + Ag** (Activa)
Calcium alginate dressing, with silver, 5 cm × 5 cm = £1.51, 10 cm × 10 cm = £3.80, 10 cm × 20 cm = £7.02, cavity dressing, 30 cm (2 g) = £5.82

**Tegaderm® Alginate Ag** (3M)
Calcium alginate and carboxymethylcellulose dressing, with silver, 5 cm × 5 cm = £1.35, 10 cm × 10 cm = £3.15, cavity dressing 3 cm × 30 cm = £3.60

**Urgosorb® Silver** (Urgo)
Alginate and carboxymethylcellulose dressing, impregnated with silver, 5 cm × 5 cm = £1.44, 10 cm × 10 cm = £3.44, 10 cm × 20 cm = £6.48, cavity dressing, 2.5 cm × 30 cm = £3.46

### Other antimicrobials

**Chlorhexidine Gauze Dressing, BP 1993**
Fabric of leno weave, wheat and warp threads of cotton and/or viscose yarn, impregnated with an antimicrobial containing chlorhexidine acetate, 5 cm × 5 cm = 27p, 10 cm × 10 cm = 57p (S&N Hlth.—Bactigras®)

**Cutimeld® Sorbact** (BSN Medical)
Low adherence acetate tissue impregnated with diallylcarbomoly chloride, (dressing pad) 7 cm × 9 cm = £3.20, 10 cm × 10 cm = £5.00, 10 cm × 20 cm = £7.80, (ovals) 4 cm ×
A8.4 Specialised dressings

A8.4.1 Protease-modulating matrix dressings

Protease-modulating matrix dressings alter the activity of proteolytic enzymes in chronic wounds; the clinical significance of this approach is yet to be demonstrated.

Appendix 8: Wound management
Appendix 8: Wound management

Gauze and Cotton Tissue

Gauze and Cotton Tissue, BP 1988
Absorbent Cotton and Viscose Ribbon Gauze, BP 1988
Absorbent Cotton, Hospital Quality
Absorbent Cotton, BP

The gauze can be used post-operatively to pack wound cavities, but adherence to the wound bed will cause bleeding and tissue damage on removal of the dressing—an advanced wound dressing (e.g. hydrocolloid-fibrous (section A8.2.4), foam (section A8.2.5), or algin—ate (section A8.2.6)) layered into the cavity is often more suitable.

Cotton

Absorbent Cotton, BP
Carded cotton fibres of not less than 10 mm average staple length, available in rolls and balls, 25 g = 71p; 100 g = £1.61; 500 g = £5.43 (most suppliers).

Drug Tariff specifies 25-g pack to be supplied when weight not stated

Absorbent Cotton, Hospital Quality
As for absorbent cotton but lower quality materials, shorter staple length etc. 100 g = £1.12; 500 g = £3.54 (most suppliers).

Drug Tariff specifies to be supplied only where specifically ordered

Note Not suitable for wound cleansing

Gauze and Tissue

Absorbent Cotton Gauze, BP 1988
Cotton fabric of plain weave, in rolls and as swabs (see below), usually Type 13 light, sterile, 90 cm (all) × 1 m = £1.06; 3 m = £2.22, 5 m = £3.46, 10 m = £6.62 (most suppliers).

1-m packet supplied when no size stated

Note Drug Tariff also includes unsterilised absorbent cotton gauze, 25 m roll = £14.93

Absorbent Cotton and Viscose Ribbon Gauze, BP 1988
Woven fabric in ribbon form with fast selvedge edges, warp yarns. 25 g = 88p; 100 g = £2.69, 500 g = £11.32 (most suppliers).

Drug Tariff specifies 25-g pack supplied where no quantity stated

Note Not recommended for wound management

Pads

Absorbent Dressing Pads, Sterile
Drizoth®, 10 cm × 20 cm = 17p (Synergy Healthcare)
PremierPad®, 10 cm × 20 cm = 18p, 20 cm × 20 cm = 25p (Shermond)

Xupad®, 10 cm × 20 cm = 17p, 20 cm × 20 cm = 28p, 20 cm × 40 cm = 40p (Richardson)

1 Surgipad® (Systagenix)
Absorbent pad of absorbent cotton and viscose in sleeve of non-woven viscose fabric, pouch 12 cm × 10 cm = 18p, 20 cm × 10 cm = 25p, 20 cm × 20 cm = 30p, 40 cm × 20 cm = 41p, non sterile pack 12 cm × 10 cm = 5p, 20 cm × 10 cm = 10p, 20 cm × 20 cm = 17p, 40 cm × 20 cm = 28p

Note Except in Sterile Dressing Pack with Non-woven Pads

Wound drainage pouches

Wound drainage pouches can be used in the management of wounds and fistulas with significant levels of exudate.

Biotrol® (Braun)
Drainage S Fistula, wound drainage pouch, mini (cut to 20 mm), 150-mL capacity = £2.44, medium (cut to 50 mm), 350-mL capacity = £3.64, large (cut to 88 mm), 500-mL capacity = £4.48

Drainage S Vision, wound drainage pouch, (cut to 50 mm), 150-mL capacity = £9.39, (cut to 88 mm), 250-mL capacity = £9.92, (cut to 100 mm), 300-mL capacity = £11.51

Dermasure® (ADI Medical)
Pouch, small (wound size up to 9 cm × 16 cm) = £15.60, medium (wound size up to 15 cm × 27 cm) = £20.80

Eakin® (Eakin)
Wound pouch, fold and tuck closure, small (wound size up to 45 mm × 30 mm) = £4.50, medium (wound size up to 110 mm × 75 mm) = £6.50, large (wound size up to 175 mm × 110 mm) = £8.50, extra large (horizontal wound up to 245 mm × 160 mm) = £15.00

Wound pouch, bung closure, small (wound size up to 45 mm × 30 mm) = £5.00, medium (wound size up to 110 mm × 75 mm) = £7.00, large (wound size up to 175 mm × 110 mm) = £9.50, extra large (horizontal or vertical wound up to 245 mm × 160 mm) = £17.00, (vertical incision wound up to 290 mm × 130 mm) = £17.00, (horizontal wound up to 245 mm × 160 mm), with access window = £19.00

Access window, for use with Eakin® pouches = £7.00

Oakmed® Option (OakMed)

Wound Manager, extra small (wound size up to 90 mm × 180 mm) = £11.00, small (horizontal wound size up to 245 mm × 160 mm) = £12.23, medium (vertical wound size up to 90 mm × 260 mm) = £12.50, large (wound size up to 160 mm × 260 mm) = £14.90, square (vertical wound up to 160 mm × 200 mm) = £13.05

Wound Manager, with access port, extra small (wound size up to 90 mm × 180 mm) = £12.02, small (horizontal wound size up to 245 mm × 160 mm) = £12.77, medium (vertical wound size up to 90 mm × 260 mm) = £15.93, square (vertical wound size up to 160 mm × 200 mm) = £13.59

Wound Manager, cut-to-fit, small (10–30 mm) = £2.25, medium (10–50 mm) = £2.49, large (10–50 mm) = £2.61
Welland® (CliniMed)
Fistula bag, wound manager, cut-to-fit (wound size up to 40 mm x 70 mm) = £2.54

Wound Drainage Collector (Hollister)
Pouch, drainable, small (wound size up to 76 mm) = £7.45, medium (wound size up to 95 mm) = £8.13, large (wound size up to 100 mm x 200 mm) = £16.10

A8.6 Complex adjunct therapies

Topical negative pressure (or vacuum-assisted) therapy requires specific wound dressings for use with the vacuum-pump equipment.

Other complex adjunct therapies include sterile larvae (maggots), and growth factors such as becalpermin (see section 13.11.7).

A8.6.1 Topical negative pressure therapy

- **Vacuum assisted closure products**
  - Exsu-Fast® (Synergy Healthcare)
    - Dressing kit, Kit 1 (small wound, low exudate) = £28.04; Kit 2 (large wound, heavy exudate) = £35.83; Kit 3 (large wound, medium to low exudate) = £35.83; Kit 4 (small wound, heavy exudate) = £28.04
  - Renasys® F/P (S&N Hlth.)
    - Dressing kit, foam dressing with round drain (plus port, dressings and fixation film), small = £19.15, medium = £22.25, large = £26.39, extra large = £42.28
  - Renasys® G (S&N Hlth.)
    - Dressing kit, non-adherent gauze and transparent film dressing, with flat drain, small = £16.64, medium = £20.86, large = £26.48, round drain, small = £16.64, large = £26.48, channel drain, medium = £20.86
  - V.A.C.® (KCI Medical)
    - GranuFoam® dressing kit, polyurethane foam dressing (with adhesive drapes and pad connector), 10 cm x 7.5 cm x 3.3 cm (small) = £21.73, 18 cm x 12.5 cm x 3.3 cm (medium) = £25.88, 26 cm x 15 cm x 3.3 cm (large) = £30.01; bridge dressing kit (for diabetic foot wound) = £30.10; with solear, small = £31.50, medium = £36.54
    - Simplace® dressing kit, spiral-cut polyurethane foam dressings, vapour-permeable adhesive film dressings (with adhesive drapes and pad connector), small = £24.99, medium = £28.73
  - WhiteFoam®, polyvinyl alcohol foam dressing 10 cm x 7.5 cm (small) = £10.00, 10 cm x 15 cm (large) = £16.01, dressing kit (with adhesive drape and pad connector), 10 cm x 7.5 cm (small) = £24.34, 10 cm x 15 cm (large) = £31.51
  - Venturi® (Talley)
    - Wound sealing kit, flat drain, standard = £15.00, large = £17.50, channel drain = £15.00
  - V1STA® (S&N Hlth.)
    - Dressing kit, flat drain, small = £16.98, medium = £21.27, large = £27.01; round drain, small = £16.98, large = £27.01; channel drain, medium = £21.27
  - WoundASSIST® (Huntleigh)
    - Wound pack, small-medium = £20.81, medium-large = £23.85, extra large = £34.95; channel drain, small-medium = £20.81, medium-large = £23.85

- **Wound drainage collection devices**
  - ActiV.A.C.® (KCI Medical)
    - Canister (with gel), 300 mL = £32.91

A8.7 Wound care accessories

A8.7.1 Dressing packs

The role of dressing packs is very limited. They are used to provide a clean or sterile working surface; some packs shown below include cotton wool balls, which are not recommended for use on wounds.

**Multiple Pack Dressing No. 1**

(Drug Tariff). Contains absorbent cotton, absorbent cotton gauze type 13 light (sterile), open-woven bandages (banded). 1 pack = £4.02

**Non-Drug Tariff Specification Sterile Dressing Pack**

Dressit® contains vitrex gloves, large apron, disposable bag, paper towel, softswabs, absorbent pad, sterile field = 60p (Richardson)

Nurse it® contains powder-free vinyl gloves, sterile laminated paper sheet, large apron, non-oven swabs, paper towel, disposable bag, compartmented tray, plastic forceps = 52p (Medicare)

Polyfield® Nitrile Patient Pack contains powder-free nitrile gloves, laminate sheet, non-oven swabs, towel, polythene disposable bag, apron = 52p (Shermond)

Propax® SDP contains paper towel, disposable bag, gauze swabs, dressing pad, sterile field = 45p (INN Medical)

Woundcare® contains nitrile gloves, sterile field, compartmented tray, large apron, disposable bag, non-oven swabs, drape = 44p (Frontier)

Sterile Dressing Pack

(Drug Tariff specification 10). Contains gauze and cotton tissue pad, gauze swabs, absorbent cotton wool balls, absorbent paper towel, water repellent inner wrapper. 1 pack = 50p (Synergy Healthcare—Vernaid®)
Appendix 8: Wound management

950 A8.7.2 Woven and fabric swabs

Sterile Dressing Pack with Non-woven Pads

A8.7.2 Woven and fabric swabs

Gauze Swab, BP 1988
Consists of absorbent cotton gauze type 13 light or absorbent cotton and viscose gauze type 1 folded into squares or rectangles of 8-ply with no cut edges exposed, sterile, 7.5 cm × 7.5 cm 5-pad packet = 30p; non-sterile, 10 cm × 10 cm, 100-pad packet = £1.34 (most suppliers)

Filmated Gauze Swab, BP 1988
As for Gauze Swab, but with thin layer of Absorbent Cotton enclosed within, non-sterile, 10 cm × 10 cm, 100-pad packet = £3.60 (Synergy Healthcare—Cost®)

Non-woven Fabric Swab
(Drug Tariff specification 28). Consists of non-woven fabric folded 4-ply; alternative to gauze swabs, type 13 light, sterile, 7.5 cm × 7.5 cm, 5-pad packet = 25p; non-sterile, 10 cm × 10 cm, 100-pad packet = 78p (Mołnycke)

Filmated Non-woven Fabric Swab
(Drug Tariff specification 29). Film of viscose fibres enclosed within non-woven viscose fabric folded 8-ply, non-sterile, 10 cm × 10 cm, 100-pad packet = £3.55 (Syntagenix—Regul®)

A8.7.3 Surgical adhesive tapes

Adhesive tapes are useful for retaining dressings on joints or awkward body parts. These tapes, particularly those containing rubber, can cause irritant and allergic reactions in susceptible patients; synthetic adhesives have been developed to overcome this problem, but they, too, may sometimes be associated with reactions. Synthetic adhesive, or silicon adhesive, tapes can be used for patients with skin reactions to plasters and strapping containing rubber, or undergoing prolonged treatment.

Adhesive tapes that are occlusive may cause skin maceration. Care is needed not to apply these tapes under tension, to avoid creating a tourniquet effect. If applied over joints they need to be orientated so that the area of maximum extensibility of the fabric is in the direction of movement of the limb.

Permeable adhesive tapes

Elastic Adhesive Tape, BP 1988
(Elastic Adhesive Plaster). Woven fabric, elastic in warp (crepe-treated viscose threads), weft of cotton and/or viscose threads, spread with adhesive mass containing zinc oxide. 4.5 m stretched × 2.5 cm = £1.88 (S&N—Elastoplast®)
For 5 cm width, see Elastic Adhesive Bandage

Permeable, Apertured Non-woven Synthetic Adhesive Tape, BP 1988
Non-woven fabric with a polyacrylate adhesive.
Hyfapi®, 5 cm × 5 m = £1.34, 10 cm × 5 m = £2.25, 10 m (roll); 2.5 cm × 1 m = £1.56, 5 cm × £2.48, 10 cm × £4.33, 15 cm × £6.42, 20 cm × £8.51, 30 cm × £12.31 (BSN Medical)
Mefix®, 5 m (all): 2.5 cm × 98p, 5 cm × £1.72, 10 cm × £2.76, 15 cm × £3.76, 20 cm × £4.82, 30 cm × £6.91 (Mölnlycke)
Omniﬁx®, 10 m (all): 5 cm × £2.24, 10 cm × £3.77, 15 cm × £5.57 (Hartmann)
Primafix®, 5 cm × 10 m = £1.50, 10 cm × 10 m = £2.20, 15 cm × 10 m = £3.25, 20 cm × 10 m = £4.00 (S&N Hlb.)

Permeable Non-woven Synthetic Adhesive Tape, BP 1988
Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass:
Clinipore®, 5 m (all): 1.25 cm × 35p, 2.5 cm × 50p, 5 cm × 99p, 2.5 cm × 10 m = 73p (Clinisupplies)
Leukofix®, 5 m (all): 1.25 cm × 52p, 2.5 cm × 83p, 5 cm × £1.45 (BSN Medical)
Leukoplast®, 5 m (all): 1.25 cm × 49p, 2.5 cm × 72p, 5 cm × £1.26 (BSN Medical)
Mediplast®, 5 m (all): 1.25 cm × 30p, 2.5 cm × 50p (Neomedic)
Micropore®, 5 m (all): 1.25 cm × 60p, 2.5 cm × 89p, 5 cm × £1.57 (3M)
Scapjon®, 5 m (all): 1.25 cm × 40p, 2.5 cm × 65p, 5 cm × £1.12, 10 cm (all), 1.25 cm × 52p, 2.5 cm × 87p, 5 cm × £1.65, 7.5 cm × £2.42 (BioDiagnostics)
Where no brand stated by prescriber, net price of tape supplied not to exceed 35p (1.25 cm), 59p (2.5 cm), 99p (5 cm)

Permeable Woven Synthetic Adhesive Tape, BP 1988
Non-extensible closely woven fabric, spread with a polymeric adhesive. 5 m (all): 1.25 cm × 78p, 2.5 cm × £1.15, 5 cm × £1.99 (Beiersdorfer—Leukosilk®)

Silicone adhesive tape
Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape
Insifo®, 2 cm × 3 m = £5.60, 4 cm × 1.5 m = £5.60 (Insight)
Mepitac®, 2 cm × 3 m = £6.56, 4 cm × 1.5 m = £6.56 (Mölnlycke)
Silitape®, 2 cm × 3 m = £5.60, 4 cm × 1.5 m = £5.60 (Advancis)

Zinc Oxide Adhesive Tape, BP 1988
(Zinc Oxide Plaster). Fabric, plain weave, warp and weft of cotton and/or viscose, spread with an adhesive containing zinc oxide. 5 m (all): 1.25 cm × 95p, 2.5 cm = £1.38, 5 cm = £2.33, 7.5 cm = £3.51 (most suppliers)

Zinc Oxide Adhesive Tape
Mediplast®, 5 m (all): 1.25 cm × 82p, 2.5 cm = £1.19, 5 cm = £1.99, 7.5 cm = £2.99 (Neomedic)
Strapp®, 5 m (all): 1.25 cm × 89p, 2.5 cm = £1.29, 5 cm = £2.17, 7.5 cm = £3.27 (BSN Medical)

 occlusive adhesive tapes

Impermeable Plastic Adhesive Tape, BP 1988
Extensible water-impermeable plastic film spread with an adhesive mass. 2.5 cm × 3 m = £1.33, 2.5 cm × 5 m = £1.99, 5 cm × 5 m = £2.53, 7.5 cm × 5 m = £3.67 (BSN Medical—Sleek®)

Impermeable Synthetic Plastic Adhesive Tape, BP 1988
Extensible water-impermeable plastic film spread with a polymeric adhesive mass. 5 m (both): 2.5 cm × £1.72, 5 cm × £3.27 (3M—Blenderm®)

A8.7.4 Adhesive dressings

Adhesive dressings (also termed ‘island dressings’) have a limited role for minor wounds only. The inclusion of an antisepctic is not particularly useful and may cause skin irritation in susceptible subjects.

Vapour permeable adhesive dressings

Vapour-permeable Waterproof Plastic Wound Dressing, BP 1993
(former Drug Tariff title: Semi-permeable Waterproof Plastic Wound Dressing). Consists of absorbent pad, may be dyed and impregnated with suitable antisepctic (see under Elastic Adhesive Dressing), attached to piece of semi-permeable waterproof surgical adhesive tape, to leave suitable adhesive margin, both pad and margin covered with suitable protector (S&N Hlb—Elastoplast Airstrip®)
A8.7.5 Skin closure dressings

Skin closure strips are used as an alternative to sutures for minor cuts and lacerations. Skin tissue adhesive (section 13.10.5) can be used for closure of minor skin wounds and for additional suture support.

**Skin closure strips, sterile**
- Leukosti®: 6.4 mm x 76 mm, 3 strips per envelope. 10 envelopes = £5.95 (S&N Hlth.)
- Omnistrip®: 6 mm x 76 mm, 3 strips per envelope. 50 envelopes = £22.50 (Hartmann)
- Steri-strip®: 6 mm x 75 mm, 3 strips per envelope. 12 envelopes = £8.52 (3M)

Drug Tariff specifies that these are specifically for personal administration by the prescriber.

A8.8 Bandages

According to their structure and performance bandages are used for dressing retention, for support, and for compression.

A8.8.1 Non-extendible bandages

Bandages made from non-extendible, woven fabrics have generally been replaced by more conformable products, therefore their role is now extremely limited. Triangular calico bandage has a role as a sling.

**Open-wove Bandage, Type 1 BP 1988**
- Cotton cloth, plain weave, warp of cotton, weft of cotton, viscose, or combination, one continuous length. 5 m (all):
  - 2.5 m = 31p, 5 cm = 52p, 7.5 cm = 74p, 10 cm = 96p (most suppliers)

**Triangular Calico Bandage, BP 1980**
- Unbleached calico right-angled triangle, 90 cm x 90 cm x 1.27 m = £1.15 (most suppliers)

A8.8.2 Light-weight conforming bandages

Lightweight conforming bandages are used for dressing retention, with the aim of keeping the dressing close to the wound without inhibiting movement or restricting blood flow. The elasticity of conforming-stretch bandages (also termed contour bandages) is greater than that of cotton conforming bandages.

**Conforming Bandage (Synthetic)**
- Fabric, plain weave, warp of polyamide, weft of viscose. 4 m stretched (all):
  - Hospifilm®, 6 cm = 13p, 8 cm = 16p, 10 cm = 18p, 12 cm = 22p (Hartmann)

**Cotton Conforming Bandage, BP 1988**
- Cotton cloth, plain weave, treated to impart some elasticity to warp and weft. 3.5 m (all):
  - Type A, 5 cm = 63p, 7.5 cm = 77p, 10 cm = 96p, 15 cm = £1.10 (BSN Medical—Esafix Crims®)

**Knitted Polyamide and Cellulose Contour Bandage, BP 1988**
- Fabric, knitted warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length. 4 m stretched (all):
  - Easigrip®, 2.5 cm = 9p, 5 cm = 10p, 7.5 cm = 15p, 10 cm = 17p, 15 cm = 30p (BSN Medical)
  - K-Band®, 5 cm = 19p, 7 cm = 24p, 10 cm = 27p, 15 cm = 47p (Urho)

- PremierBand®, 4 m (all):
  - 5 cm = 12p, 7.5 cm = 17p, 10 cm = 17p, 15 cm = 33p (Steraid)

Polyamide and Cellulose Contour Bandage
- Peha-haft®, cohesive, latex-free, 4 m (all):
  - 2.5 cm = 68p, 4 cm = 44p, 6 cm = 52p, 8 cm = 62p, 10 cm = 71p, 12 cm = 84p (Hartmann)
- PremierBand®, 4 m (all):
  - 5 cm = 12p, 7.5 cm = 14p, 10 cm = 17p, 15 cm = 25p (Shermond)

Polyamide and Cellulose Contour Bandage, BP 1988 (Nylon and Viscose Stretch Bandage)
- Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched (all):
  - Acti-Wrap®, cohesive, latex-free, 6 cm = 44p, 8 cm = 64p, 10 cm = 76p (Activa)
  - Easifix®, 5 cm = 33p, 7.5 cm = 40p, 10 cm = 47p, 15 cm = 80p (BSN Medical)
  - Kontour®, cohesive, 5 cm = 28p, 7.5 cm = 35p, 10 cm = 40p, 15 cm = 66p (Easigrip)

Polyamide and Cellulose Contour Bandage, BP 1993

- Fabric, knitted warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched (all):
  - K-Band®, 5 cm = 10p, 7 cm = 15p, 10 cm = 17p, 15 cm = 30p (CliniMed)
  - Knit Fix®, 5 cm = 12p, 7 cm = 17p, 10 cm = 17p, 15 cm = 33p (Steraid)

**Elasticated Surgical Tubular Stockinette, Foam padded**

- Knit Band®, 5 cm = 10p, 7 cm = 15p, 10 cm = 17p, 15 cm = 30p (CliniMed)
- Knit Fix®, 5 cm = 12p, 7 cm = 17p, 10 cm = 17p, 15 cm = 33p (Steraid)

**Polyamide and Cellulose Contour Bandage**

- Peha-haft®, cohesive, latex-free, 4 m (all):
  - 2.5 cm = 68p, 4 cm = 44p, 6 cm = 52p, 8 cm = 62p, 10 cm = 71p, 12 cm = 84p (Hartmann)
- PremierBand®, 4 m (all):
  - 5 cm = 12p, 7.5 cm = 14p, 10 cm = 17p, 15 cm = 25p (Shermond)

**Polyamide and Cellulose Contour Bandage, BP 1988** (Nylon and Viscose Stretch Bandage)

- Fabric, plain weave, warp of polyamide filament, weft of cotton or viscose, fast edges, one continuous length, 4 m stretched (all):
  - Acti-Wrap®, cohesive, latex-free, 6 cm = 44p, 8 cm = 64p, 10 cm = 76p (Activa)
  - Easifix®, 5 cm = 33p, 7.5 cm = 40p, 10 cm = 47p, 15 cm = 80p (BSN Medical)
  - Kontour®, cohesive, 5 cm = 28p, 7.5 cm = 35p, 10 cm = 40p, 15 cm = 66p (Easigrip)
  - Moll elast®, latex-free, 4 cm = 28p, 6 cm = 34p (Activa)
  - Sillyn®, 7.5 cm = 57p, 10 cm = 68p, 15 cm = 98p (Molynyeke)
  - Stayform®, 5 cm = 29p, 7.5 cm = 36p, 10 cm = 40p, 15 cm = 68p (Robinsons)

A8.8.3 Tubular bandages and garments

Tubular bandages are available in different forms, according to the function required of them. Some are used under orthopaedic casts and some are suitable for protecting areas to which creams or ointments (other than those containing potent corticosteroids) have been applied. The conformability of the elasticated versions makes them particularly suitable for retaining dressings on difficult parts of the body or for soft tissue injury, but their use as the only means of applying pressure to an oedematous limb or to a varicose ulcer is not appropriate, since the pressure they exert is inadequate.

**Compression hosiery** (section A8.9.1) reduces the recurrence of venous leg ulcers and should be considered for use after wound healing.

**Silk clothing** is available as an alternative to elasticated viscose stockinette garments, for use in the management of severe eczema and allergic skin conditions (see below).

### Elasticated Surgical Tubular Stockinette, Foam padded

*(Drug Tariff specification 25)*

Fabric as for Elasticated Tubular Bandage with polyurethane foam lining. Heel, elbow, knee, small = £2.86, medium = £3.09, large = £3.30, sacral, medium, and large (all) = £14.76 (Medlock—Tubipad®)

Uses relief of pressure and elimination of friction in relevant area; porosity of foam lining allows normal water loss from skin surface

### Elasticated Tubular Bandage, BP 1993

(formerly Elasticated Surgical Tubular Stockinette)

Knitted fabric, elastinated threads of rubber-cored polyamide or polyester with cotton or cotton and viscose yarn. Tubular lengths 50 cm and 1 m, widths 6.25 cm, 6.75 cm, 7.5 cm, 8.75 cm, 10 cm, 12 cm. Synergy—Configrip®, Easigrip—Easigrrip®, Sallis—Estiban®, Medlock—Tubigrrip®. Where no size stated by prescriber the 50 cm length should be supplied and width endorsed.
Appendix 8: Wound management

Elasticated Viscose Stockinette

(Drug Tariff specification 46). Lightweight plain-knitted elasticated tubular bandage.

**Acti-Fast**, 3.5 cm red line (small limb), length 1 m = 62p; 5 cm green line (medium limb), length 1 m = 58p, 3 m = £1.62, 5 m = £2.81; 7.5 cm blue line (large limb), length 1 m = £1.02, 5 m = £4.04; 10.75 cm yellow line (child trunk), length 1 m = £1.45, 3 m = £4.10, 5 m = £7.10; 17.5 cm beige line (adult trunk), length 1 m = £2.12, 5 m = £9.45, 6 m = £16.04; 25 cm beige line (adult trunk), length 1 m = £1.83; vest (long-sleeved), adult, small = £12.75, medium = £14.54, large = £16.58; vest (short-sleeved), adult, small = £9.00, medium = £11.88, large = £14.63; tights (pair) large = £16.58, one-size = £14.58; gloves, (small-medium or medium-large adult, extra small or small child) = £5.50 (Mölnlycke).

**Non-elasticated**

**Cotton Stockinette, Bleached, BP 1988**

Knitted fabric, cotton yarn, tubular length, 1 m (all), 2.5 cm = 34p, 5 cm = 75p, 6 cm = 10p = £4.32 (A&J, Medlock).

**Uses**: 1 m lengths, basis (with wadding) for Plaster of Paris bandages etc.; 6 m, length, compression bandage.

**Ribbed Cotton and Viscose Surgical Tubular Stockinette, BP 1988**

Knitted fabric, cotton yarn, tubular length, 1 m (all), 2.5 cm = 34p, 5 cm = 75p, 6 cm = 10p = £4.32 (A&J, Medlock).

** Uses**: protective dressings with tar-based and other non-steroidal ointments.

**Silk Clothing**

Knitted, medical grade silk clothing can be used as an adjunct to normal treatment for severe eczema and allergic skin conditions. When used in combination with medical creams and ointments, care should be taken to ensure that the medication is fully absorbed into the skin before the silk clothing is worn; silk garments are not suitable for use in direct contact with emollients used in ‘wet wrapping techniques’.

**DermaSilk** (Espere)

Knitted silk fabric, hypoallergenic, serum-free, body suit, child 0–3 months (height 62 cm) = £38.18, 3–6 months (height 68 cm) = £35.65, 6–9 months (height 74 cm) = £36.67, 9–12 months (height 74 cm) = £38.25, 12–18 months (height 86 cm) = £36.69, 18–24 months (height 92 cm) = £39.29, 2–3 years (height 98 cm) = £38.71, 3–4 years (height 110 cm) = £39.73, boxer shorts, adult (male), small–XXXL = £39.95, briefs, 3–4 years = £20.95, 5–6 years = £20.95, 7–8 years = £26.47, 9–12 months (height 62 cm) = £25.83, 12–18 months (height 70 cm) = £29.39, facial mask, child (head circumference up to 47 cm) = £15.30, child (head circumference up to 50 cm) = £15.30, teen or adult = £20.19; gloves, adult, small, medium, large, or extra large = £19.33, child (small or medium) = £13.98; leggins, child 0–3 months (height 62 cm) = £25.83, 3–4 months (height 68 cm) = £26.47, 9–12 months (height 74 cm) = £27.90, 12–18 months (height 86 cm) = £27.49, 18–24 months (height 92 cm) = £28.94, 2–3 years (height 98 cm) = £28.51, 3–4 years (height 110 cm) = £28.51, adult, small–XXL = £45.66, adult, small–XXXL = £48.49, 7–8 years = £50.51, 10–12 years = £52.50, undersocks, (heelless), 2 pairs standard or longer.
length = £22.95, undersocks, adult shoe-size 5½–6, 7–8½, 9–10½, 11–13, child shoe-size 3–8, 9–1, 2–5, 2 pairs = £17.45

**Cotton, Polyamide and Elastane Bandage**

**Cotton Crepe Bandage**

Crepe Bandage, BP 1988

Fabric, plain weave, warp of crepe-twisted cotton threads, weft of cotton threads; stretch bandage, lighter than cotton crepe, 4.5 m stretched (all).

**Cotton Stretch Bandage, BP 1988**

Fabric, plain weave, warp of crepe-twisted cotton threads, weft of cotton threads; stretch bandage, lighter than cotton crepe, 4.5 m stretched (all).

**Hosipricrepe**® 233, 5 cm = 52p; 7.5 cm = 72p; 10 cm = 96p; 15 cm = £1.36 (Steraid)

**PremierBand**®, 5 cm = 45p, 7.5 cm = 63p, 10 cm = 79p; 15 cm = £1.18 (Shermond)

**Cotton Suspensory Bandage**

(Drug Tariff). Type 1: cotton net bag with draw tapes and webbing waistband; small, medium, and large (all) = £1.59, extra large = £1.68. Type 2: cotton net bag with elastic edge and webbing waistband with elastic insertion; small, medium, and large (all) = £1.90, extra large = £1.96. Type 3: supplied to be endorsed

**Knitted Elasticom and Viscose Bandage**

Knitted fabric, viscose and elastomer yarn.

**Type 2 (light support bandage)**

**CliniLite**®, 4.5 m (all), 5 cm = 44p, 7.5 cm = 61p, 10 cm = 89p, 15 cm = £1.16 (Clinisupplies)

**K-Lite**®, 4.5 m stretched, 5 cm = 52p, 7.5 cm = 73p, 10 cm = 95p, 15 cm = £1.36, 5.2 m stretched, 10 cm = £1.69 (Urgo)

**Koil-Firm**®, 4.5 m stretched, 5 cm = 53p, 7.5 cm = 75p, 10 cm = 95p, 15 cm = 96p (Steraid)

**Type 3a (light compression bandage)**

**CliniPlus**®, 8.7 m × 10 cm = £1.80 (Clinisupplies)

**Elset®**, 6 m stretched, 10 cm = £2.46, 15 cm = £2.66; 8 m stretched, 10 cm = £3.14; 12 m stretched, 15 cm = £5.27 (Molnlycke)

**K-Plus®**, 8.7 m stretched, 10 cm = £2.14, long, 10.25 m stretched, 10 cm = £2.47 (Urgo)

**Profore® #3**, 8.7 m stretched, 10 cm = £3.70, latex-free = £4.02 (S&N Hlth.)

L, 8.6 m stretched, 10 cm = £2.07 (S&N Hlth.)

**A8.8.4 Support bandages**

Light support bandages, which include the various forms of crepe bandage, are used in the prevention of oedema; they are also used to provide support for mild sprains and joints but their effectiveness has not been proven for this purpose. Since they have limited extensibility, they are able to provide light support without exerting undue pressure. For a warning against injudicious compression see section A8.6.7.

**Crepe Bandage, BP 1988**

Fabric, plain weave, warp of wool threads and crepe-twisted cotton threads, weft of cotton threads; stretch bandage. 4.5 m stretched (all). 5 cm = 92p; 7.5 cm = £1.16, 15 cm = £1.23 (most suppliers)

**Cotton Crepe Bandage**

Light support bandage, 4.5 m stretched (all). 5 cm = 44p; 7.5 cm = 67p, 10 cm = £1.27 (Steraid—Hosipricrepe® 239)

**Cotton Crepe Bandage, BP 1988**

Fabric, plain weave, warp of crepe-twisted cotton threads, weft of cotton and/or viscose threads; stretch bandage. 4.5 m stretched (both). 7.5 cm = £2.88; 10 cm = £3.70 (most suppliers)

**Cotton, Polyamide and Elastane Bandage**

Fabric, cotton, polyamide, and elastane; light support bandage (Type 2). 4.5 m stretched (all).

**Hosipliite®**, 5 cm = 34p, 7.5 cm = 47p, 10 cm = 57p, 15 cm = 84p (Hartmann)

**Neosport®**, 5 cm = 54p, 7.5 cm = 73p, 10 cm = 91p, 15 cm = £1.12 (Necomedic)

**Profore® #2**, 10 cm = £1.27, latex-free = £1.35 (S&N Hlth.)

**Setocrepe**, 10 cm = £1.13 (Molnlycke)

**Softcrepe®**, 5 cm = 64p, 7.5 cm = 91p, 10 cm = £1.16, 15 cm = £1.67 (BSN Medical)

**A8.8.5 Adhesive bandages**

Elastic adhesive bandages are used to provide compression in the treatment of varicose veins and for the support of injured joints; they should no longer be used for the support of fractured ribs and clavicles. They have also been used with zinc paste bandage in the treatment of venous ulcers, but they can cause skin reactions in susceptible patients and may not produce sufficient pressures for healing (significantly lower than those provided by other compression bandages).

**Elastic Adhesive Bandage, BP 1993**

Woven fabric, elastic in warp (crepe-twisted cotton threads), weft of cotton and/or viscose threads spread with adhesive mass containing zinc oxide. 4.5 m stretched (all). 5 cm = £3.39; 7.5 cm = £4.90, 10 cm = £6.52 (BSN Medical—Elastoplast® Bandage). Drug Tariff specifies 7.5 cm width supplied when size not stated

**A8.8.6 Cohesive bandages**

Cohesive bandages adhere to themselves, but not to the skin, and are useful for providing support for sports use where ordinary stretch bandages might become displaced and adhesive bandages are inappropriate. Care is needed in their application, however, since the loss of ability for movement between turns of the bandage to equalise local areas of high tension carries the potential for creating a tourniquet effect. Cohesive bandages can be used to support sprained joints and as
an outer layer for multi-layer compression bandaging; they should not be used if arterial disease is suspected.

Cohesive extensible bandages
Coban® (3M)  
Bandage, 6 m (stretched), 10 cm = £2.76

K-Press® (Urgo)  
Bandage, 6.5 m × 10 cm (0, short) = £2.78, 7.5 m, 18–25 cm ankle circumference, 8 cm = £3.06, 10 cm = £3.25, 12 cm = £4.09; 10.5 m, 25–32 cm ankle circumference, 8 cm = £3.33, 10 cm = £3.55, 12 cm = £4.48

Profore® #4 (S&N Hlth.)  
Bandage, 2.5 m (unstretched) = £3.06, latex-free = £3.32

Ultra Fast® (Robinsons)  
Bandage, 6.3 m (stretched), 10 cm = £2.59

A.8.7 Compression bandages

High compression products are used to provide the high compression needed for the management of gross varices, post-thrombotic venous insufficiency, venous leg ulcers, and gross oedema in average-sized limbs. Their use calls for an expert knowledge of the elastic properties of the products and experience in the technique of providing careful graduated compression. Incorrect application can lead to uneven and inadequate pressures or to hazardous levels of pressure. In particular, injudicious use of compression in limbs with arterial disease has been reported to cause severe skin and tissue necrosis (in some instances calling for amputation). Doppler testing is required before treatment with compression. Oral pentoxifylline (section 2.6.4) can be used to reduce swelling associated with lymphoedema, 3 m (stretched), 10 cm (red) = £5.51, 10 cm (yellow) = £6.02, 10 cm (green) = £6.52.

Short stretch compression bandage
Short stretch bandages help to reduce oedema and promote healing of venous leg ulcers. They are also used to reduce swelling associated with lymphoedema. They are applied at full stretch over padding (see Sub-compression Wadding Bandage below) which protects areas of high pressure and sites at high risk of pressure damage.

Actiban® (Activa)  
Bandage, 5 m (all), 8 cm = £3.16, 10 cm = £3.40, 12 cm = £4.14

Actico® (Activa)  
Bandage, cohesive, 6 m (all), 4 cm = £2.25, 6 cm = £2.64, 8 cm = £3.03, 10 cm = £3.15, 12 cm = £4.02

Comprilan® (BSN Medical)  
Bandage, 5 m (all), 6 cm = £2.52, 8 cm = £2.96, 10 cm = £3.18; 12 cm = £3.87

Rosidal K® (Activa)  
Bandage, 5 m (all), 4 cm = £1.76, 6 cm = £2.45, 8 cm = £2.93, 10 cm = £3.20, 12 cm = £3.88, 10 m × 10 cm = £5.57

Silkolan® (Urgo)  
Bandage, 5 m (all), 8 cm = £3.00, 10 cm = £3.39

Sub-compression wadding bandage
Advasoft® (Advancis)  
Padding, 3.5 m unstretched, 10 cm = 37p

Cellona® Undercast Padding (Activa)  
Padding, 2.75 m unstretched (all), 5 cm = 29p, 7.5 cm = 35p, 10 cm = 43p, 15 cm = 55p

Coban® 2 Comfort Layer (3M)  
Padding, 2.7 m unstretched, 10 cm = £5.50

Flexi-Ban® (Activa)  
Padding, 3.5 m unstretched, 10cm = 47p

K-Soft® (Urgo)  
Padding, absorbent, 3.5 m unstretched, 10 cm = 43p, 4.5 m unstretched, 10 cm = 53p

K-Tech® (Urgo)  
Padding, 5 m × 10 cm (0, short) = £3.76, 6 m, 18–25 cm ankle circumference, 8 cm = £4.26, 10 cm = £4.51, 12 cm = £5.69, 7.5 m, 25–32 cm ankle circumference, 8 cm = £4.64, 10 cm = £5.92, 12 cm = £6.21

Ortho-Band Plus® (Steraid)  
Padding, 10 cm × 3.5 cm unstretched = 37p

Profore® #1 (S&N Hlth.)  
Padding, viscose fleece, 3.5 m unstretched, 10 cm = 66p, latex-free = 72p

ProGuide® #1 (S&N Hlth.)  
Padding, polyester and viscose fleece, 4 m unstretched, 10 cm = £1.53

Softex® (Mölnlycke)  
Padding, absorbent, 3.5 m unstretched, 10 cm = 69p

SurePress® (Convatec)  
Padding, absorbent, 3 m unstretched, 10 cm = 56p

Ulato Soft® (Robinsons)  
Padding, absorbent, 3.5 m unstretched, 10 cm = 39p

Velband® (BSN Medical)  
Padding, absorbent, 4.5 m unstretched, 10 cm = 67p

A.8.8 Multi-layer compression bandaging

Multi-layer compression bandaging systems are an alternative to High Compression Bandages (section A.8.7) for the treatment of venous leg ulcers. Compression is achieved by the combined effects of two or three extensible bandages applied over a layer of orthopaedic wadding and a wound contact dressing.

Four layer systems
K-Four® (Urgo)  
K-Four® #1 (K-Soft®—see Sub-compression Wadding Bandage, above); K-Four® #2 (K-Lite®—see Knitted Elastomer and Viscose Bandage, p. 953); K-Four® #3 (K-Plus®—see Knitted Elastomer and Viscose Bandage, p. 953); K-Three®—see High compression bandages, above; K-Four® #4 (K-Flex®); 6 m (stretched), 10 cm = £2.84, 7 m (stretched), 10 cm = £3.25

954 A8.8.7 Compression bandages  BNF 61
Multi-layer compression bandaging kit, four layer system, for ankle circumference up to 18 cm = £6.73, 18–25 cm = £6.64, 25–30 cm = £6.44, above 30 cm = £6.87; reduced compression, 18 cm and above = £4.21

**Profore®** (S&N Hlth.)

Profore® wound contact layer (see Knitted Viscose Primary Dressing, p. 937). Profore® W1 (see Sub-compression Wadding Bandage, p. 954); Profore® W2 (see Cotton, Polyamide and Elastane Bandage, p. 953); Profore® W3 (see Knitted Elastomer and Viscose Bandage, p. 953); Profore® W4 (see Cohesive bandages, p. 954). Profore® Plus 3 m (unstretched), 10 cm = £3.46, latex-free = £3.70

**Zinc Paste Bandage, BP 1993**

Cotton fabric, plain weave, impregnated with suitable paste containing zinc oxide and ichthammol; requires additional bandaging, 6 m × 7.5 cm = £3.47 S&N Hlth.—Ichthopaste® (6/2%), excipients: include cetostearyl alcohol

#### Uses

- section 13.5

### Steripaste® (Mölnlycke)

Cotton fabric, selvedge weave impregnated with paste containing zinc oxide (requires additional bandaging), 6 m × 7.5 cm = £3.24

#### Excipients

- polyisobutene 80

### Medicated stocking

**Zipzoc** (S&N Hlth.)

Sterile rayon stocking impregnated with ointment containing zinc oxide 20%. 4-pouch carton = £12.52, 10-pouch carton = £31.30

#### Note

- Can be used under appropriate compression bandages or hosiery in chronic venous insufficiency

### Two layer systems

**Coban® 2 (3M)**

Multi-layer compression bandaging kit, two layer system (latex-free, foam bandage and cohesive compression bandage), one size = £8.08. Coban® 2 Lite (reduced compression), one size = £8.08

#### K-Two® (Lurgo)

**K-Tech®** (see Sub-compression Wadding Bandages, p. 954); **K-Press®** (see Cohesive Bandages, p. 954)

### Compression hosiery and garments

**Compression (elastic) hosiery** is used to treat conditions associated with chronic venous insufficiency, to prevent recurrence of thrombosis, or to reduce the risk of further venous ulceration after treatment with compression bandaging (section A8.8.7). Doppler testing to confirm arterial sufficiency is required before recommending the use of compression hosiery.

Before elastic hosiery can be dispensed, the quantity (single or pair), article (including accessories), and compression class must be specified by the prescriber. There are different compression values for graduated compression hosiery and lymphoedema garments (see table below). All dispensed elastic hosiery articles must state on the packaging that they conform with Drug Tariff technical specification No. 40, for further details see Drug Tariff.

#### Note

- Graduated compression tights are **not**

A8.9.1 Graduated compression hosiery

Class 1 Light Support

Hosiery, compression at ankle 14–17 mmHg, thigh length or below knee with knitted in heel. 1 pair, circular knit (standard), thigh length = £7.61, below knee = £6.95, (made-to-measure), thigh length = £37.79, below knee = £23.64; lightweight elastic net (made-to-measure), thigh length = £20.38, below knee = £15.91

Uses superficial or early varices, varicosis during pregnancy

Class 2 Medium Support

Hosiery, compression at ankle 18–24 mmHg, thigh length or below knee with knitted in heel. 1 pair, circular knit (standard), thigh length = £11.31, below knee = £10.16, (made-to-measure), thigh length = £37.79, below knee = £23.64; net (made-to-measure), thigh length = £20.38, below knee = £15.91; flat bed (made-to-measure, only with closed heel and open toe), thigh length = £37.79, below knee = £23.64

Uses varices of medium severity, ulcer treatment and prophylaxis, mild oedema, varicosis during pregnancy

Class 3 Strong Support

Hosiery, compression at ankle 25–35 mmHg, thigh length or below knee with open or knitted in heel. 1 pair, circular knit (standard), thigh length = £13.40, below knee = £11.52, (made-to-measure), thigh length = £37.79, below knee = £23.64; flat bed (made-to-measure, only with open heel and open toe), thigh length = £37.79, below knee = £23.64

Uses gross varices, post thrombotic venous insufficiency, gross oedema, ulcer treatment and prophylaxis

Accessories

In addition to the product listed below, accessories such as application aids for hosiery are available, see Drug Tariff for details

Suspender

Suspender, for thigh stockings = 66p, belt (specification 13), = £4.99, fitted (additional price) = 62p

Anklets

Class 2 Medium Support

Anklets, compression 18–24 mmHg, circular knit (standard and made-to-measure), 1 pair = £6.66; flat bed (standard and made-to-measure) = £13.84, net (made-to-measure) = £13.09

Class 3 Strong Support

Anklets, compression 25–35 mmHg, circular knit (standard and made-to-measure), 1 pair = £9.09; flat bed (standard) = £9.29, (made-to-measure) = £13.84

Knee caps

Class 2 Medium Support

Knee caps, compression 18–24 mmHg, circular knit (standard and made-to-measure), 1 pair = £6.66; flat bed (standard and made-to-measure) = £13.84, net (made-to-measure) = £10.87

Class 3 Strong Support

Knee caps, compression 25–35 mmHg, circular knit (standard and made-to-measure), 1 pair = £8.88; flat bed (standard) = £8.88, (made-to-measure) = £13.84

A8.9.2 Lymphoedema garments

Lymphoedema compression garments are used to maintain limb shape and prevent additional fluid retention. Either flat-bed or circular knitting methods are used in the manufacture of elasticated compression garments. Seamless, circular-knitted garments (in standard sizes) can be used to prevent swelling if the lymphoedema is well controlled and if the limb is in good shape and without skin folds. Flat-knitted garments (usually made-to-measure) with a seam, provide greater rigidity and stiffness to maintain reduction of lymphoedema following treatment with compression bandages.

A standard range of light, medium, or high compression garments are available, as well as low compression (12–16 mmHg) armsleeves, made-to-measure garments up to compression 90 mmHg, and accessories—see Drug Tariff for details.

Note There are different compression values for lymphoedema garments and graduated compression hosiery, see table, p. 955.
Numbers following the preparation entries in the BNF correspond to the code numbers of the cautionary labels that pharmacists are recommended to add when dispensing. It is also expected that pharmacists will counsel patients when necessary.

Counselling needs to be related to the age, experience, background, and understanding of the individual patient. The pharmacist should ensure that the patient understands how to take or use the medicine and how to follow the correct dosage schedule. Any effects of the medicine on driving or work, any foods or medicines to be avoided, and what to do if a dose is missed should also be explained. Other matters, such as the possibility of staining of the clothes or skin by a medicine should also be mentioned.

For some preparations there is a special need for counselling, such as an unusual method or time of administration or a potential interaction with a common food or domestic remedy, and this is indicated where necessary.

**Original packs** Most preparations are dispensed in unbroken original packs that include further advice for the patient in the form of patient information leaflets. Label 10 may be of value where appropriate. More general leaflets advising on the administration of preparations such as eye drops, eye ointments, inhalers, and suppositories are also available.

**Scope of labels** In general no label recommendations have been made for injections on the assumption that they will be administered by a healthcare professional or a well-instructed patient. The labelling is not extensive and pharmacists are recommended to use their professional discretion in labelling new preparations and those for which no labels are shown.

Individual labelling advice is not given on the administration of the large variety of antacids. In the absence of instructions from the prescriber, and if on enquiry the patient has had no verbal instructions, the directions given under ‘Dose’ should be used on the label.

It is recognised that there may be occasions when pharmacists will use their knowledge and professional discretion and decide to omit one or more of the recommended labels for a particular patient. In this case counselling is of the utmost importance. There may also be an occasion when a prescriber does not wish additional cautionary labels to be used, in which case the prescription should be endorsed ‘NCL’ (no cautionary labels). The exact wording that is required instead should then be specified on the prescription.

Pharmacists label medicines with various wordings in addition to those directions specified on the prescription. Such labels include ‘Shake the bottle’, ‘For external use only’, and ‘Store in a cool place’, as well as ‘Discard’.

... days after opening’ and ‘Do not use after ...’, which apply particularly to antibiotic mixtures, diluted liquid and topical preparations, and to eye-drops. Although not listed in the BNF these labels should continue to be used when appropriate; indeed, ‘For external use only’ is a legal requirement on external liquid preparations, while ‘Keep out of the reach of children’ is a legal requirement on all dispensed medicines. Care should be taken not to obscure other relevant information with adhesive labelling.

It is the usual practice for patients to take standard tablets with water or other liquid and for this reason no separate label has been recommended.

The label wordings recommended by the BNF apply to medicines dispensed against a prescription. Patients should be aware that a dispensed medicine should never be taken by, or shared with, anyone other than for whom the prescriber intended it. Therefore, the BNF does not include warnings against the use of a dispensed medicine by persons other than for whom it was specifically prescribed.

The label or labels for each preparation are recommended after careful consideration of the information available. However, it is recognised that in some cases this information may be either incomplete or open to a different interpretation. The BNF will therefore be grateful to receive any constructive comments on the labelling suggested for any preparation.

### Recommended label wordings

**For BNF 61 (March 2011)** a revised set of advisory and cautionary labels has been introduced. All of the existing labels have been user-tested, and the revised wording selected reflects terminology that is better understood by patients.

Wordings which can be given as separate warnings are labels 1–19, 29–30, and 32. New wordings which can be incorporated in an appropriate position in the directions for dosage or administration are labels 21–28. A label has been omitted for number 20; labels 31 and 33 no longer apply to any medicines in the BNF and have therefore been deleted.

If separate labels are used it is recommended that the wordings be used without modification. If changes are made to suit computer requirements, care should be taken to retain the sense of the original.

1 **Warning:** This medicine may make you sleepy

To be used on preparations for children containing antihistamines, or other preparations given to children where the warnings of label 2 on driving or alcohol would not be appropriate.
Cautionary and advisory labels

2 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol.

To be used on preparations for adults that can cause drowsiness, thereby affecting the ability to drive and operate hazardous machinery; label 1 is more appropriate for children. It is an offence to drive while under the influence of drugs.

Some of these preparations only cause drowsiness in the first few days of treatment and some only cause drowsiness in higher doses.

In such cases the patient should be told that the advice applies until the effects have worn off. However many of these preparations can produce a slowing of reaction time and a loss of mental concentration that can have the same effects as drowsiness. Avoidance of alcoholic drink is recommended because the effects of CNS depressants are enhanced by alcohol. Strict prohibition however could lead to some patients not taking the medicine. Pharmacists should therefore explain the risk and encourage compliance, particularly in patients who may think they already tolerate the effects of alcohol (see also label 3).

Queries from patients with epilepsy regarding fitness to drive should be referred back to the patient’s doctor.

Side-effects unrelated to drowsiness that may affect a patient’s ability to drive or operate machinery safely include blurred vision, dizziness, or nausea. In general, no label has been recommended to cover these cases, but the patient should be suitably counselled.

3 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines.

To be used on preparations containing monoamine oxidase inhibitors; the warning to avoid alcohol and dealcoholised (low alcohol) drink is covered by the patient information leaflet.

Also to be used as for label 2 but where alcohol is not an issue.

4 Warning: Do not drink alcohol while taking this medicine.

To be used on preparations where a reaction such as flushing may occur if alcohol is taken (e.g. metronidazole). Alcohol may also enhance the hypoglycaemia produced by some oral antidiabetic drugs but routine application of a warning label is not considered necessary.

5 Do not take indigestion remedies 2 hours before or after you take this medicine.

To be used with label 25 on preparations coated to resist gastric acid (e.g. enteric-coated tablets). This is to avoid the possibility of premature dissolution of the coating in the presence of an alkaline pH.

Label 5 also applies to drugs such as ketoconazole where the absorption is significantly affected by antacids; the usual period of avoidance recommended is 2 hours.

6 Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine.

To be used on preparations containing aloxacinc and some other quinolones, doxycycline, lymecycline, minocycline, and penicillamine. These drugs chelate calcium, iron, magnesium, and zinc and are less well absorbed when taken with calcium-containing antacids or preparations containing iron or zinc. These incompatible preparations should be taken 2 hours apart.

7 Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine.

To be used on preparations containing ciprofloxacin, norfloxacin or tetracyclines that chelate calcium, iron, magnesium, and zinc and are thus less available for absorption; these incompatible preparations should be taken 2 hours apart. Doxycycline, lymecycline and minocycline are less liable to form chelates and therefore only require label 6 (see above).

8 Warning: Do not stop taking this medicine unless your doctor tells you to stop.

To be used on preparations that contain a drug which is required to be taken over long periods without the patient necessarily perceiving any benefit (e.g. anti-tuberculous drugs).

Also to be used on preparations that contain a drug whose withdrawal is likely to be a particular hazard (e.g. clonidine for hypertension). Label 10 (see below) is more appropriate for corticosteroids.

9 Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop.

To be used on preparations where a course of treatment should be completed to reduce the incidence of relapse or failure of treatment.

The preparations are antimicrobial drugs given by mouth. Very occasionally, some may have severe side-effects (e.g. diarrhoea in patients receiving clindamycin) and in such cases the patient may need to be advised of reasons for stopping treatment quickly and returning to the doctor.

10 Warning: Read the additional information given with this medicine.

To be used particularly on preparations containing anticoagulants, lithium and oral corticosteroids. The appropriate treatment card should be given to the patient and any necessary explanations given.

This label may also be used on other preparations to remind the patient of the instructions that have been given.

11 Protect your skin from sunlight—even on a bright cloudy day. Do not use sunbath.

To be used on preparations that may cause phototoxic or photoallergic reactions if the patient is exposed to ultraviolet radiation. Many drugs other than those listed in Appendix 9 (e.g. phenothiazines and sulphonamides) may, on rare occasions, cause reactions in susceptible patients. Exposure to high intensity ultraviolet radiation from sunlamps and sunbeds is particularly likely to cause reactions.

12 Do not take anything containing aspirin while taking this medicine.

To be used on preparations containing probenecid and sulfinpyrazone whose activity is reduced by aspirin.

Label 12 should not be used for antiocoagulants since label 10 is more appropriate.

13 Dissolve or mix with water before taking.

To be used on preparations that are intended to be dissolved in water (e.g. soluble tablets) or mixed with water (e.g. powders, granules) before use. In a few cases other liquids such as fruit juice or milk may be used.

14 This medicine may colour your urine. This is harmless.

To be used on preparations that may cause the patient’s urine to turn an unusual colour. These include triamterene (blue under some lights), levo-dopa (dark reddish), and rifampicin (red).

15 Caution: flammable. Keep your body away from fire or flames after you have put on the medicine.

To be used on preparations containing sufficient flammable solvent to render them flammable if exposed to a naked flame.

16 Dissolve the tablet under your tongue—do not swallow.

Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening.

To be used on glyceryl trinitrate tablets to remind the patient not to transfer the tablets to plastic or less suitable containers.

17 Do not take more than . . . in 24 hours.

To be used on preparations for the treatment of acute migraine except those containing ergotamine, for which label 18 is used. The dose form should be
specified, e.g. tablets or capsules. It may also be used on preparations for which no dose has been specified by the prescriber.

18 Do not take more than . . . in 24 hours. Also, do not take more than . . . in any one week To be used on preparations containing ergotamine. The dose form should be specified, e.g. tablets or suppositories.

19 Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol To be used on preparations containing hypnotics (or some other drugs with sedative effects) prescribed to be taken at night. On the rare occasions (e.g. nitrazepam in epilepsy) when hypnotics are prescribed for daytime administration this label would clearly not be appropriate. Also to be used as an alternative to the label 2 wording (the choice being at the discretion of the pharmacist) for anxiolytics prescribed to be taken at night.

It is hoped that this wording will convey adequately the problem of residual morning sedation after taking ‘sleeping tablets’.

21 Take with or just after food, or a meal To be used on preparations that are liable to cause gastric irritation, or those that are better absorbed with food.

22 Take 30 to 60 minutes before food To be used on some preparations whose absorption is thereby improved. Most oral antibacterials require label 23 instead (see below).

23 Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food To be used on oral preparations whose absorption may be reduced by the presence of food and acid in the stomach.

24 Suck or chew this medicine To be used on preparations that should be sucked or chewed. The pharmacist should use discretion as to which of these words is appropriate.

25 Swallow this medicine whole. Do not chew or break To be used on preparations that are enteric-coated or designed for modified-release.

26 Dissolve this medicine under your tongue To be used on preparations designed for sublingual use. Patients should be advised to hold under the tongue and avoid swallowing until dissolved. The buccal mucosa between the gum and cheek is occasionally specified by the prescriber.

27 Take with a full glass of water To be used on preparations that should be well diluted (e.g. chloral hydrate), where a high fluid intake is required (e.g. sulphonamides), or where water is required to aid the action (e.g. methylcellulose). The patient should be advised that ‘a full glass’ means at least 150 mL. In most cases fruit juice, tea, or coffee may be used.

28 Spread thinly on the affected skin only To be used on external preparations that should be applied sparingly (e.g. corticosteroids, dithranol).

29 Do not take more than 2 at any one time. Do not take more than 8 in 24 hours To be used on containers of dispensed solid dose preparations containing paracetamol for adults when the instruction on the label indicates that the dose can be taken on an ‘as required’ basis. The dose form should be specified, e.g. tablets or capsules. This label has been introduced because of the serious consequences of overdosage with paracetamol.

30 Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine To be used on all containers of dispensed preparations containing paracetamol.

31 Contains aspirin. Do not take aspirin while taking this medicine To be used on containers of dispensed preparations containing aspirin while taking this medicine.

32 Contains aspirin. Do not take anything else containing aspirin while taking this medicine To be used on containers of dispensed preparations containing aspirin when the name on the label does not include the word ‘aspirin’.

## Dental Practitioners’ Formulary

### List of Dental Preparations

The following list has been approved by the appropriate Secretaries of State, and the preparations therein may be prescribed by dental practitioners on form FP10D (GP14 in Scotland, WP10D in Wales).

**Sugar-free** versions, where available, are preferred.

</table>

1. Indications approved by the ACBS are: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy or sicca syndrome
2. The BP directs that when soluble aspirin tablets are prescribed, dispersible aspirin tablets should be dispensed
3. This preparation does not appear in subsequent editions of the BP
4. The BP directs that when Paediatric Paracetamol Oral Suspension or Paediatric Paracetamol Mixture is prescribed and no strength stated Paracetamol Oral Suspension 120 mg/5 mL should be dispensed
Sodium Chloride Mouthwash, Compound, BP
Sodium Fluoride Mouthwash, BP
Sodium Fluoride Oral Drops, BP
Sodium Fluoride Tablets, BP
Sodium Fluoride Toothpaste 0.619%, DPF
Sodium Fluoride Toothpaste 1.1%, DPF
Sodium Fusidate Ointment, BP
Temazepam Oral Solution, BP
Temazepam Tablets, BP
Tetracycline Tablets, BP

Preparations in this list which are not included in the BP or BFC are described under Details of DPF preparations, below

Details of DPF preparations
Preparations on the List of Dental Preparations which are specified as DPF are described as follows in the DPF.
Although brand names have sometimes been included for identification purposes preparations on the list should be prescribed by non-proprietary name.

Amoxicillin Oral Powder (proprietary product: Amoxil) amoxicillin (as trihydrate) 3 g sachet

Artificial Saliva Oral Spray (proprietary product: Xerine) consists of water, sorbitol, carmellose (carboxymethylcellulose), potassium chloride, sodium chloride, potassium phosphate, magnesium chloride, calcium chloride and other ingredients, pH neutral

Azithromycin Oral Suspension 200 mg/5 mL (proprietary product: Zithromax) azithromycin 200 mg/5 mL when reconstituted with water

Betamethasone Soluble Tablets 500 micrograms (proprietary product: Betnesol Soluble Tablets), betamethasone (as sodium phosphate) 500 micrograms

Carmellose Gelatin Paste (proprietary product: Orabase Oral Paste), gelatin, pectin, carmellose sodium, 16.58% of each in a suitable basis

Cetirizine Hydrochloride Tablets cetirizine hydrochloride 10 mg

Chlorhexidine Oral Spray (proprietary product: Corsodyl Oral Spray), chlorhexidine gluconate 0.2%

Chlorhexidine Oromucosal Solution, Alcohol-free, 0.2% (proprietary product: Periogard Oromucosal Solution), chlorhexidine gluconate 0.2%

Clarithromycin Oral Suspension 125 mg/5 mL (proprietary product: Biaxin) clarithromycin 125 mg/5 mL when reconstituted with water

Clarithromycin Oral Suspension 250 mg/5 mL (proprietary product: Biaxin) clarithromycin 250 mg/5 mL when reconstituted with water

Doxycycline Tablets 20 mg (proprietary product: Periostat), doxycycline (as hyclate) 20 mg

Fluconazole Capsules 50 mg (proprietary product: Diflucan) fluconazole 50 mg

Fluconazole Oral Suspension 50 mg/5 mL (proprietary product: Diflucan) fluconazole 50 mg/5 mL when reconstituted with water

Lansoprazole Capsules (proprietary product: Prevacid) lansoprazole 15 mg and 30 mg capsules, enclosing e/c granules

Lidocaine 5% Ointment lidocaine 5% in a suitable basis

Lidocaine Spray 10% (proprietary product: Xylocaine Spray), lidocaine 10% supplying 10 mg lidocaine/spray

Loratadine Tablets loratadine 10 mg

Mouthwash Solution-tablets consist of tablets which may contain antimicrobial, colouring and flavouring agents in a suitable soluble effervescent basis to make a mouthwash suitable for dental purposes

Penciclovir Cream (proprietary product: Vectavir Cream), penciclovir 1%

Saliva Stimulating Tablets (proprietary product: SST), citric acid, malic acid and other ingredients in a sorbitol base

Sodium Fluoride Toothpaste 0.619% (proprietary product: Duraphat ‘2800 ppm’ Toothpaste), sodium fluoride 0.619%

Sodium Fluoride Toothpaste 1.1% (proprietary product: Duraphat ‘5000 ppm’ Toothpaste), sodium fluoride 1.1%

Nurse Prescribers’ Formulary for Community Practitioners

Nurse Prescribers’ Formulary Appendix (Appendix NPF). List of preparations approved by the Secretary of State which may be prescribed on form FP10P (form HS21(N) in Northern Ireland, form GP10(N) in Scotland, forms WP10CN and WP10PN in Wales) by Nurses for National Health Service patients.

Community practitioners who have completed the necessary training may only prescribe items appearing in the nurse prescribers’ list set out below. Community Practitioner Nurse Prescribers are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved generic name.

Medicinal Preparations

Preparations on this list which are not included in the BP or BPC are described on p. 975

Almond Oil Ear Drops, BP
Arachis Oil Enema, NPF
1 Aspirin Tablets, Dispersible, 300 mg, BP
Bisacodyl Suppositories, BP (includes 5-mg and 10-mg strengths)
Bisacodyl Tablets, BP
Catheter Maintenance Solution, Chlorhexidine, NPF
Catheter Maintenance Solution, Sodium Chloride, NPF
Catheter Maintenance Solution, ‘Solution G’, NPF
Catheter Maintenance Solution, ‘Solution R’, NPF
Chlorhexidine Gluconate Alcoholic Solutions containing at least 0.05%
Chlorhexidine Gluconate Aqueous Solutions containing at least 0.05%
Choline Salicylate Dental Gel, BP
Clotrimazole Cream 1%, BP
Co-danthramer Capsules, NPF
Co-danthramer Capsules, Strong, NPF
Co-danthramer Oral Suspension, NPF
Co-danthramer Oral Suspension, Strong, NPF
Co-danthrusate Capsules, BP
Co-danthrusate Oral Suspension, NPF
Crotamiton Cream, BP
Crotamiton Lotion, BP
Dimeticone barrier creams containing at least 10%
Dimeticone Lotion, NPF
Docusate Capsules, BP
Docusate Enema, NPF
Docusate Oral Solution, BP
Docusate Oral Solution, Paediatric, BP
Econazole Cream 1%, BP

1 Max. 96 tablets; max. pack size 32 tablets

Emollients as listed below:

Aquadrate® 10% w/w Cream
Aqueous Cream, BP
Arachis Oil, BP
Balneum® Plus Cream
Cetraben® Emollient Cream
Dermamist®
Diprobase® Cream
Diprobase® Ointment
Doublebase®
E45® Cream
E45® Itch Relief Cream
Emulsifying Ointment, BP
Eucerin® Intensive 10% w/w Urea Treatment Cream
Eucerin® Intensive 10% w/w Urea Treatment Lotion
Hydromol® Cream
Hydromol® Intensive
2Hydromol® Ointment
Hydrous Ointment, BP
Lipobase®
Liquid and White Soft Paraffin Ointment, NPF
Neutrogena® Norwegian Formula Dermatological Cream
Nutraplus® Cream
Olatum® Cream
Olatum® Junior Cream
Paraffin, White Soft, BP
Paraffin, Yellow Soft, BP
2 QV® Cream
2 QV® Lotion
QV® Wash
Ultrabase®
Unguentum M®
2Zerobase® Cream
2Zerocream®
2Zeroguent® Cream

Emollient Bath Additives as listed below:

1 Balneum®
1 Balneum Plus® Bath Oil
Cetraben® Emollient Bath Additive
Dermalo® Bath Emollient
Diprobase®
Doublebase® Emollient Bath Additive
Doublebase® Emollient Shower Gel
Doublebase® Emollient Wash Gel
Hydromol® Bath and Shower Emollient
Olatum® Emollient
Olatum® Junior Bath Additive
Olatum® Gel
2 QV® Bath Oil
Zerolatum® Emollient Medicinal Bath Oil
2 Zeroneum® Bath Oil
Zeroule® Bath Oil

2 Included in the Drug Tariff (Part IXA)
3 Except pack sizes that are not to be prescribed under the NHS (see Part XVIIIA of the Drug Tariff, Part XI of the Northern Ireland Drug Tariff)

### Appliances and Reagents (including Wound Management Products)

Community Practitioner Nurse Prescribers in England, Wales and Northern Ireland can prescribe any appliance or reagent in the relevant Drug Tariff. In the Scottish Drug Tariff, Appliances and Reagents which may not be prescribed by Nurses are annotated Nx.

**Appliances** (including Contraceptive Devices) as listed in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 (Appliances) and Part 2 (Dressings) of the Scottish Drug Tariff)

**Incontinence Appliances** as listed in Part IXB of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 5 of the Scottish Drug Tariff)

**Stoma Appliances and Associated Products** as listed in Part IXC of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 6 of the Scottish Drug Tariff)

**Chemical Reagents** as listed in Part IXR of the Drug Tariff

Details of NPF preparations

Preparations on the Nurse Prescribers’ Formulary which are not included in the BP or BPC are described as follows in the Nurse Prescribers’ Formulary.

Although brand names have sometimes been included for identification purposes, it is recommended that non-proprietary names should be used for prescribing medicinal preparations in the NPF except where a non-proprietary name is not available.

### Arachis Oil Enema
- arachis oil 100%

### Catheter Maintenance Solution, Chlorhexidine
- proprietary product: *Uro-Tainer Chlorhexidine*, chlorhexidine 0.02%

### Catheter Maintenance Solution, Sodium Chloride
- proprietary products: *Optiflo S*, *Uro-Tainer Sodium Chloride*, *Urifax-S*, sodium chloride 0.9%

### Catheter Maintenance Solution, ‘Solution G’
- proprietary products: *Optiflo G*, *Uro-Tainer Suby G*, *Urifax G*, citric acid 3.23%, magnesium oxide 0.38%, sodium bicarbonate 0.7%, disodium edetate 0.01%

---

1. Except for indications and doses that are
2. Max. 96 tablets; max. pack size 32 tablets

---

**Nurse Prescribers’ Formulary**

**Details of NPF preparations**

Preparations on the Nurse Prescribers’ Formulary which are not included in the BP or BPC are described as follows in the Nurse Prescribers’ Formulary.

Although brand names have sometimes been included for identification purposes, it is recommended that non-proprietary names should be used for prescribing medicinal preparations in the NPF except where a non-proprietary name is not available.

### Arachis Oil Enema
- arachis oil 100%

### Catheter Maintenance Solution, Chlorhexidine
- proprietary product: *Uro-Tainer Chlorhexidine*, chlorhexidine 0.02%

### Catheter Maintenance Solution, Sodium Chloride
- proprietary products: *Optiflo S*, *Uro-Tainer Sodium Chloride*, *Urifax-S*, sodium chloride 0.9%

### Catheter Maintenance Solution, ‘Solution G’
- proprietary products: *Optiflo G*, *Uro-Tainer Suby G*, *Urifax G*, citric acid 3.23%, magnesium oxide 0.38%, sodium bicarbonate 0.7%, disodium edetate 0.01%

---

1. Except for indications and doses that are
2. Max. 96 tablets; max. pack size 32 tablets
Catheter Maintenance Solution, ‘Solution R’
(proprietary products: OptiFlo R; Uro-Tainer Solution R; Ureflex R), citric acid 6%, glucoconolactone 0.6%, magnesium carbonate 2.8%, disodium edetate 0.01%

Chlorhexidine gluconate alcoholic solutions
(proprietary products: Chloraprep; Hydrex Solution; Hydrex spray), chlorhexidine gluconate in alcoholic solution

Chlorhexidine gluconate aqueous solutions
(proprietary product: Unisept) chlorhexidine gluconate in aqueous solution

Co-danthramer Capsules
co-danthramer 25/200 (dantron 25 mg, poloxamer ‘188’ 200 mg)

Co-danthramer Capsules, Strong
co-danthramer 37.5/500 (dantron 37.5 mg, poloxamer ‘188’ 500 mg)

Co-danthramer Oral Suspension
(proprietary product: Codalax), co-danthramer 25/200 in 5 mL (dantron 25 mg, poloxamer ‘188’ 200 mg/5 mL)

Co-danthramer Oral Suspension, Strong
(proprietary product: Codalax Forte), co-danthramer 75/1000 in 5 mL (dantron 75 mg, poloxamer ‘188’ 1 g/5 mL)

Co-danthrusate Oral Suspension
(proprietary product: Normax), co-danthrusate 50/60 (dantron 50 mg, docusate sodium 60 mg/5 mL)

Dimeticone barrier creams
(proprietary products: Conotrane Cream, dimeticone ‘350’ 22%; Siopel Barrier Cream, dimeticone ‘1000’ 10%; Vasogen Barrier Cream, dimeticone 20%), dimeticone 10–22%

Dimeticone Lotion
(proprietary product: Hedrin), dimeticone 4%

Docusate Enema
(proprietary product: Norgalax Micro-enema) docusate sodium 120 mg in 10 g

Folic Acid Oral Solution 400 micrograms/5 mL
(proprietary product: Folicare), folic acid 400 micrograms/5 mL

Liquid and White Soft Paraffin Ointment
liquid paraffin 50%, white soft paraffin 50%

Macrogol Oral Powder, Compound
macrogol ‘3350’ (polyethylene glycol ‘3350’) 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 g, potassium chloride 46.6 mg/sachet (proprietary products: Movicol, Laxido)

Note Amount of potassium chloride varies according to flavour of Movicol® as follows: plain-flavour (sugar-free) = 50.2 mg/sachet, lime and lemon flavour = 46.6 mg/sachet, chocolate flavour = 31.7 mg/sachet. 1 sachet when reconstituted with 125 mL water provides K+ 5.4 mmol/litre

Macrogol Oral Powder, Compound, Half-strength
(proprietary product: Movicol-Half), macrogol ‘3350’ (polyethylene glycol ‘3350’) 6.563 g, sodium bicarbonate 89.3 g, sodium chloride 175.4 mg, potassium chloride 23.3 mg/sachet

Malathion aqueous lotions
(proprietary products: Derbac-M Liquid), malathion 0.5% in an aqueous basis

Mebendazole Oral Suspension
(proprietary product: Vermox), mebendazole 100 mg/5 mL

Mebendazole Tablets
(proprietary products: Over, Vermox), mebendazole 100 mg

Mouthwash Solution-tablets
consist of tablets which may contain antimicrobial, colouring and flavouring agents in a suitable soluble effervescent basis to make a mouthwash

Nicolotine Inhalation Cartridge for Oro-mucosal Use
(proprietary products: Nicorette Inhalator), nicotine 10 mg

Nicolotine Lozenge
nicotine (as bitartrate) 1 mg or 2 mg (proprietary product: Nicotinell Mint Lozenge) or nicotine (as polacrilax) 2 mg or 4 mg (proprietary product: NiQuitin Lozenges), or nicotine (as resinate complex) 1.5 mg (proprietary product: Nicopass Lozenge)

Nicolotine Medicated Chewing Gum
(proprietary products: Nicorette Gum, Nicotinell Gum, NiQuitin Gum), nicotine 2 mg or 4 mg

Nicolotine Nasal Spray
(proprietary product: Nicorette Nasal Spray), nicotine 500 micrograms/metered spray

Nicolotine Sublingual Tablets
(proprietary product: Nicorette Microtab), nicotine (as a cyclodextrin complex) 2 mg

Nicolotine Transdermal Patches
releasing in each 12 hours, nicotine approx. 5 mg, 10 mg, or 15 mg (proprietary product: Boots NicAssist Patch, Nicorette Patch) or releasing in each 24 hours nicotine approx. 7 mg, 14 mg, or 21 mg (proprietary products: Nicopatch, Nicotinell TTS, NiQuitin)

Permethrin Cream
(proprietary product: Lyclear Dermal Cream), permethrin 5%

Phosphate Suppositories
(proprietary product: Carbalax), sodium acid phosphate (anhydrous) 1.3 g, sodium bicarbonate 1.08 g

Piperazine and Senna Powder
(proprietary product: Prispen Oral Powder), piperazine phosphate 4 g, sennosides 15.3 mg/sachet

Senna Oral Solution
(proprietary product: Senokot Syrup), sennosides 7.5 mg/5 mL

Senna and Ispaghula Granules
(proprietary product: Manevac Granules), senna fruit 12.4%, ispaghula 54.2%

1. For exemption, see p. 415
2. For use with inhalation mouthpiece; to be prescribed as either a starter pack (6 cartridges with inhalator device and holder) or refill pack (42 cartridges with inhalator device)
3. To be prescribed as either a starter pack (2 x 15-tablet discs with dispenser) or refill pack (7 x 15-tablet discs)
4. Prescriber should specify the brand to be dispensed
Sodium Citrate Compound Enema  
(proprietary products: Micolette Micro-enema; Micralax Micro-enema; Relaxit Micro-enema), sodium citrate 450 mg with glycerol, sorbitol and an anionic surfactant.

Sodium Picosulfate Capsules  
(proprietary products: Dulcolax Perles), sodium picosulfate 2.5 mg.

Sodium Picosulfate Elixir  
(proprietary products: Dulcolax Liquid), sodium picosulfate 5 mg/5 mL.

Sterculia Granules  
(proprietary product: Normacol Granules), sterculia 62%.

Sterculia and Frangula Granules  
(proprietary product: Normacol Plus Granules), sterculia 62%, frangula (standardised) 8%.

Zinc Oxide and Dimeticone Spray  
(proprietary product: Sprilon), dimeticone 1.04%, zinc oxide 12.5% in a pressurised aerosol unit.

Zinc Oxide Impregnated Medicated Bandage  
(proprietary product: Steripaste), sterile cotton bandage impregnated with paste containing zinc oxide 15%.

Zinc Oxide Impregnated Medicated Stocking  
(proprietary product: Zipzoc), sterile rayon stocking impregnated with ointment containing zinc oxide 20%.

### Nurse Independent Prescribing

Nurse Independent Prescribers (formerly known as Extended Formulary Nurse Prescribers) are able to prescribe any medicine for any medical condition, including some Controlled Drugs (see below).

Nurse Independent Prescribers must work within their own level of professional competence and expertise. They are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved non-proprietary name.

Nurse Independent Prescribers are also able to prescribe independently the Controlled Drugs in the table below, solely for the medical conditions indicated.

For information on the mixing of medicines by Nurse Independent Prescribers, see Mixing of medicines prior to administration in clinical practice—responding to legislative changes, National Prescribing Centre, May 2010 (available at www.npc.co.uk/policy/mixing/mixing_medicines.htm).

Up-to-date information and guidance on nurse independent prescribing is available on the Department of Health website at www.dh.gov.uk/nonmedicalprescribing.

#### Controlled drugs prescribable by Nurse Independent Prescribers solely for the medical conditions indicated

</table>

**Note:** For the purposes of nurse independent prescribing, palliative care means the care of patients with advanced, progressive illness.
Non-medical prescribing

A range of non-medical healthcare professionals can prescribe medicines for patients as either Independent or Supplementary Prescribers.

Independent prescribers are practitioners responsible and accountable for the assessment of patients with previously undiagnosed or diagnosed conditions and for decisions about the clinical management required, including prescribing. They are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved non-proprietary name.

Supplementary prescribing is a partnership between an independent prescriber (a doctor or a dentist) and a supplementary prescriber to implement an agreed Clinical Management Plan for an individual patient with that patient’s agreement.

Independent and Supplementary Prescribers are identified by an annotation next to their name in the relevant professional register.

Up-to-date information and guidance on non-medical prescribing is available on the Department of Health website at www.dh.gov.uk/nonmedicalprescribing.

For information on the mixing of medicines by Independent and Supplementary Prescribers, see Mixing of medicines prior to administration in clinical practice—responding to legislative changes, National Prescribing Centre, May 2010 (available at www.npc.co.uk/policy/mixing/mixing_medicines.htm).

For information on the supply and administration of medicines to groups of patients using Patient Group Directions, see p. 4.

Nurses

For further information on Nurse Independent Prescribing, see Nurse Prescribers’ Formulary, p. 977.

Optometrists

Optometrist Independent Prescribers can prescribe any licensed medicine for ocular conditions affecting the eye and the tissues surrounding the eye, except Controlled Drugs or medicines for parenteral administration. Optometrist Independent Prescribers must work within their own level of professional competence and expertise.

Pharmacists

Pharmacist Independent Prescribers can prescribe any medicine, except Controlled Drugs, for any medical condition. Pharmacist Independent Prescribers must work within their own level of professional competence and expertise.
### Index of manufacturers

The following is an alphabetical list of manufacturers and other companies referenced in the BNF, with their medicines information or general contact details. For information on ‘special-order’ manufacturers and specialist importing companies see p. 988.

</table>
Unlicensed medicines are available from ‘special-order’ manufacturers and specialist-importing companies; the MHRA maintains a register of these companies at http://tinyurl.com/cdslke.

Licensed hospital manufacturing units also manufacture ‘special-order’ products as unlicensed medicines, the principal NHS units are listed below. A database (Pro-File; www.pro-file.nhs.uk) provides information on medicines manufactured in the NHS; access is restricted to NHS pharmacy staff.

The Association of Commercial Specials Manufacturers may also be able to provide further information about commercial companies (www.acsm.uk.com).

The MHRA recommends that an unlicensed medicine should only be used when a patient has special requirements that cannot be met by use of a licensed medicine.

**Yellowcard**  
COMMISSION ON HUMAN MEDICINES (CHM)

**It’s easiest to report online at www.yellowcard.gov.uk**

**SUSPECTED ADVERSE DRUG REACTIONS**

If you suspect an adverse reaction may be related to one or more drugs/vaccines/complementary remedies, please complete this Yellow Card. See ‘Adverse reactions to drugs’ section in BNF or www.yellowcard.gov.uk for guidance. Do not be put off reporting because some details are not known.

**PATIENT DETAILS**

- Patient Initials: ________
- Sex: M / F
- Ethnicity: ________________
- Weight if known (kg): ________
- Age (at time of reaction): ________________
- Identification number (e.g. Your Practice or Hospital Ref): ________________

**SUSPECTED DRUG(S)/VACCINE(S)**

<table>
<thead>
<tr>
<th>Drug/Vaccine (Brand if known)</th>
<th>Batch</th>
<th>Route</th>
<th>Dosage</th>
<th>Date started</th>

**SUSPECTED REACTION(S)**

Please describe the reaction(s) and any treatment given:

Outcome:  
- Recovered: [ ]  
- Recovering: [ ]  
- Continuing: [ ]  
- Other: [ ]

Date reaction(s) started: ________________  
Date reaction(s) stopped: ________________

Do you consider the reactions to be serious?  
Yes / No

If yes, please indicate why the reaction is considered to be serious (please tick all that apply):
- [ ] Patient died due to reaction
- [ ] Life threatening
- [ ] Congenital abnormality
- [ ] Involved or prolonged inpatient hospitalisation
- [ ] Involved persistent or significant disability or incapacity
- [ ] Medically significant; please give details: ____________________________

How to use the Cardiovascular Risk Prediction Charts for Primary Prevention

These charts are for estimating cardiovascular disease (CVD) risk (non-fatal myocardial infarction and stroke, coronary and stroke death and new angina pectoris) for individuals who have not already developed coronary heart disease (CHD) or other major atherosclerotic disease. They are an aid to making clinical decisions about how intensively to intervene on lifestyle and whether to use antihypertensive, lipid lowering and anti-platelet medication, but should not replace clinical judgment.

- The use of these charts is not appropriate for patients who have existing diseases which already put them at high risk such as:
  - coronary heart disease or other major atherosclerotic disease;
  - familial hypercholesterolaemia or other inherited dyslipidaemias;
  - renal dysfunction including diabetic nephropathy;
  - type 1 and 2 diabetes mellitus.

- The charts should not be used to decide whether to introduce antihypertensive medication when blood pressure is persistently at or above 160/100 mmHg or when target organ damage due to hypertension is present. In both cases antihypertensive medication is recommended regardless of CVD risk. Similarly the charts should not be used to decide whether to introduce lipid-lowering medication when the ratio of serum total to HDL cholesterol exceeds 6. Such medication is generally then indicated regardless of estimated CVD risk.

- To estimate an individual's absolute 10-year risk of developing CVD choose the chart for his or her sex, lifetime smoking status and age. Within this square identify the level of risk according to the point where the coordinates for systolic blood pressure and the ratio of total cholesterol to high density lipoprotein (HDL) cholesterol meet. If no HDL cholesterol result is available, then assume this is 1.0 mmol/litre and the lipid scale can be used for total cholesterol alone.

- Higher risk individuals (red areas) are defined as those whose 10-year CVD risk exceeds 20%, which is approximately equivalent to the coronary heart disease risk of > 15% over the same period.

- The chart also assists in identifying individuals whose 10-year CVD risk is moderately increased in the range 10–20% (orange areas) and those in whom risk is lower than 10% over 10 years (green areas).

- Smoking status should reflect lifetime exposure to tobacco and not simply tobacco use at the time of assessment. For example, those who have given up smoking within 5 years should be regarded as current smokers for the purposes of the charts.

- The initial blood pressure and the first random (non-fasting) total cholesterol and HDL cholesterol can be used to estimate an individual's risk. However, the decision on using drug therapy should generally be based on repeat risk factor measurements over a period of time.

- Men and women do not reach the level of risk predicted by the charts for the three age bands until they reach the ages 49, 59, and 69 years respectively. The charts will overestimate current risk most in the under 40s. Clinical judgement must be exercised in deciding on treatment in younger patients. However, it should be recognised that blood pressure and cholesterol tend to rise most and HDL cholesterol to decline most in younger people already with adverse levels. Left untreated, their risk at the age of 49 years is likely to be higher than the projected risk shown on the age-under-50-years chart. From age 70 years the CVD risk, especially for men, is usually ≥ 20% over 10 years and the charts will underestimate true total CVD risk.

- These charts (and all other currently available methods of CVD risk prediction) are based on groups of people with untreated levels of blood pressure, total cholesterol and HDL cholesterol. In patients already receiving antihypertensive therapy in whom the decision is to be made about whether to introduce lipid-lowering medication, or vice versa, the charts can only act as a guide. Unless recent pre-treatment risk factor values are available it is generally safest to assume that CVD risk is higher than that predicted by current levels of blood pressure or lipids on treatment.

- CVD risk is also higher than indicated in the charts for:
  - those with a family history of premature CVD (male first-degree relatives aged < 55 years and female first-degree relatives aged < 65 years) which increases the risk by a factor of approximately 1.5;
  - men with HDL cholesterol < 1 mmol/litre or women with HDL cholesterol < 1.2 mmol/litre;
  - those with raised triglyceride levels (> 1.7 mmol/litre);
  - those with BMI ≥ 30 kg/m²;
  - women with premature menopause;
  - those who are not yet diabetic, but have impaired fasting glycaemia (6.1–6.9 mmol/ litre) or impaired glucose tolerance (2 hour glucose ≥ 7.8 mmol/litre but < 11.1 mmol/litre in an oral glucose tolerance test).

- The charts have not been validated in ethnic minorities and in some may underestimate CVD risk. For example, in people originating from the Indian subcontinent it is safest to assume that the CVD risk is higher than predicted from the charts (1.4 times).
An individual can be shown on the chart the direction in which his or her risk of CVD can be reduced by changing smoking status, blood pressure, or cholesterol, but it should be borne in mind that the estimate of risk is for a group of people with similar risk factors and that within that group there will be considerable variation in risk. It should also be pointed out in younger people that the estimated risk will generally not be reached before the age of 50, if their current blood pressure and lipid levels remain unchanged. The charts are primarily to assist in directing intervention to those who typically stand to benefit most.

The estimation of CVD risk in NICE clinical guideline 67 (May 2008): Lipid modification–Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease (available at www.nice.org.uk) differs from that shown here as follows:

- estimated CVD risk increases by a factor of 1.5 in those with a family history of premature CHD (male first-degree relatives aged < 55 years and female first-degree relatives aged < 65 years)
- estimated CVD risk increases by a factor of 1.5–2 if more than one first-degree relative has a history of premature CHD
- estimated CVD risk for South Asian men is increased by a factor of 1.4
- CVD risk is higher than estimated in those with BMI > 40 kg/m²

The NICE guideline does not include the recommendation to treat all patients with a serum total to HDL cholesterol ratio of greater than 6 with lipid-lowering drugs.

The NICE guideline advises that the following factor is also taken into account when calculating CVD risk:

- presence of left ventricular hypertrophy

In addition, NICE advises that all patients over the age of 75 years should be considered at increased risk of CVD, and are likely to benefit from treatment.

In February 2010, NICE withdrew the recommendation that the Framingham risk equation should be the equation of choice for assessment of CVD risk, but agreed that it should be considered as one of the possible equations to use.
CVD risk 10–20% over next 10 years
CVD risk <10% over next 10 years
CVD risk >20% over next 10 years

SBP = systolic blood pressure mmHg
TC : HDL = serum total cholesterol to HDL cholesterol ratio

Nondiabetic Men

(Continued over)
Nondiabetic Women

Non-smoker

Age under 50 years

Age 50–59 years

Age 60 years and over

Smoker

SBP = systolic blood pressure mmHg
TC : HDL = serum total cholesterol to HDL cholesterol ratio

CVD risk over next 10 years

© Central Manchester and Manchester Children’s University Hospitals NHS Trust
ADULT ADVANCED LIFE SUPPORT ALGORITHM

Unresponsive? Not breathing or only occasional gasps

Call Resuscitation Team

CPR 30:2
Attach defibrillator/monitor
Minimise interruptions

Assess rhythm

Shockable (VF/pulseless VT)

Non-shockable (PEA/Asystole)

1 Shock
Immediately resume CPR for 2 min
Minimise interruptions

Return of spontaneous circulation
Immediate post cardiac arrest treatment
• Use ABCDE approach
• Controlled oxygenation and ventilation
• 12-lead ECG
• Treat precipitating cause
• Temperature control / therapeutic hypothermia

Immediately resume CPR for 2 min
Minimise interruptions

During CPR
• Ensure high-quality CPR: rate, depth, recoil
• Plan actions before interrupting CPR
• Give oxygen
• Consider advanced airway and capnography
• Continuous chest compressions when advanced airway in place
• Vascular access (intravenous, intraosseous)
• Give adrenaline every 3-5 min
• Correct reversible causes

Reversible causes
• Hypoxia
• Hypovolaemia
• Hypo- / hyperkalaemia / metabolic
• Hypothermia
• Thrombosis - coronary or pulmonary
• Tamponade - cardiac
• Toxins
• Tension pneumothorax

Reproduced with the kind permission of the Resuscitation Council (UK) from Resuscitation Guidelines, October 2010
Medical emergencies in the community

Drug treatment outlined below is intended for use by community healthcare professionals. Only drugs that are used for immediate relief are shown; advice on supporting care is not given. Where the patient’s condition requires investigation and further treatment, the patient should be transferred to hospital promptly.

Anaphylaxis (section 3.4.3)

Adrenaline injection (1 mg/mL (1 in 1000))
- By intramuscular injection
  CHILD UNDER 6 YEARS 150 micrograms (0.15 mL), repeated every 5 minutes if necessary
  CHILD 6–12 YEARS 300 micrograms (0.3 mL), repeated every 5 minutes if necessary
  CHILD 12–18 YEARS 500 micrograms (0.5 mL), repeated every 5 minutes if necessary
  ADULT 500 micrograms (0.5 mL), repeated every 5 minutes if necessary

High-flow oxygen (section 3.6) and intravenous fluids should be given as soon as available.

Chlorphenamine injection by intramuscular or intravenous injection (section 3.4.1) may help counter histamine-mediated vasodilation and bronchoconstriction.

Hydrocortisone (preferably as sodium succinate) by intravenous injection (section 6.3.2) has delayed action but should be given to severely affected patients to prevent further deterioration.

Angina: unstable (section 2.10.1)
Aspirin dispersible tablets (75 mg, 300 mg)
- By mouth (dispersed in water or chewed)
  ADULT 300 mg

Plus
- either Gliceryl trinitrate aerosol spray (400 micrograms/metered dose)
  Sublingually
  ADULT 1–2 sprays, repeated as required
- or Gliceryl trinitrate tablets (300 micrograms, 500 micrograms, 600 micrograms)
  Sublingually
  ADULT 0.3–1 mg, repeated as required

Asthma: acute (section 3.1)

Regard each emergency consultation as being for severe acute asthma until shown otherwise; failure to respond adequately at any time requires immediate transfer to hospital

Either salbutamol aerosol inhaler (100 micrograms/metered inhalation)
- By aerosol inhalation via large-volume spacer (and a close-fitting face mask if child under 3 years)
  ADULT and CHILD 2–10 puffs each inhaled separately, repeated every 10–20 minutes or as necessary
  or salbutamol nebuliser solution (1 mg/mL, 2 mg/mL)
- By inhalation of nebulised solution (via oxygen-driven nebuliser if available)
  CHILD UNDER 5 YEARS 2.5 mg every 20–30 minutes or as necessary
  CHILD 5–12 YEARS 2.5–5 mg every 20–30 minutes or as necessary
  ADULT 5 mg every 20–30 minutes or as necessary

or terbutaline nebuliser solution (2.5 mg/mL)
- By inhalation of nebulised solution (via oxygen-driven nebuliser if available)
  CHILD UNDER 5 YEARS 5 mg every 20–30 minutes or as necessary
  CHILD 5–12 YEARS 5–10 mg every 20–30 minutes or as necessary
  ADULT 10 mg every 20–30 minutes or as necessary

Plus (in all cases)
either prednisolone tablets (or prednisolone soluble tablets) (5 mg)
- By mouth
  CHILD UNDER 12 YEARS 1–2 mg/kg (max. 40 mg) once daily for up to 3 days or longer if necessary; if child has been taking an oral corticosteroid for more than a few days, give prednisolone 2 mg/kg (max. 60 mg) once daily
  ADULT 40–50 mg once daily for 5 days

or hydrocortisone (preferably as sodium succinate)
- By intravenous injection
  CHILD UNDER 12 YEARS 4 mg/kg every 6 hours until conversion to oral prednisolone is possible; CHILD UNDER 2 YEARS max. 25 mg, 2–5 YEARS max. 50 mg, 6–12 YEARS max. 100 mg
  ADULT 100 mg every 6 hours until conversion to oral prednisolone is possible

High-flow oxygen (section 3.6) if available (via face mask in children)

Monitor response 15 to 30 minutes after nebulisation; if any signs of acute asthma persist, arrange hospital admission. While awaiting ambulance, repeat nebulised beta, agonist (as above) and give with

ipratropium nebuliser solution (250 micrograms/mL)
- By inhalation of nebulised solution (via oxygen-driven nebuliser if available)
  CHILD UNDER 12 YEARS 250 micrograms, repeated every 20–30 minutes for the first 2 hours, then every 4–6 hours as necessary
  ADULT 500 micrograms every 4–6 hours as necessary
**Convulsive (including febrile) seizures lasting longer than 5 minutes**  
(section 4.8.2 and section 4.8.3)  
*Either diazepam rectal solution (2 mg/mL, 4 mg/mL)*  
- By rectum  
  - **NEONATE** 1.25–2.5 mg, repeated once after 10–15 minutes if necessary  
  - **CHILD 1 MONTH–2 YEARS** 5 mg, repeated once after 10–15 minutes if necessary  
  - **CHILD 2–12 YEARS** 5–10 mg, repeated once after 10–15 minutes if necessary  
  - **ADULT** and **CHILD OVER 12 YEARS** 10–20 mg  
  - **ELDERLY** 10 mg, repeated once after 10–15 minutes if necessary  
*or midazolam buccal liquid (10 mg/mL) or injection solution given by buccal route*  
- By buccal administration, repeated once if necessary  
  - **NEONATE** 300 micrograms/kg  
  - **CHILD 1–6 MONTHS** 300 micrograms/kg (max. 2.5 mg)  
  - **CHILD 6 MONTHS–1 YEAR** 2.5 mg  
  - **CHILD 1–5 YEARS** 5 mg  
  - **CHILD 5–10 YEARS** 7.5 mg  
  - **ADULT** and **CHILD OVER 10 YEARS** 10 mg

**Glucose intravenous infusion (20%)**  
- By intravenous injection into large vein  
  - **ADULT** 50 mL

**Meningococcal disease**  
(Table 1, section 5.1)  
*Benzylpenicillin sodium injection (600 mg, 1.2 g)*  
- By intravenous injection (or by intramuscular injection if venous access not available)  
  - **NEONATE** 300 mg  
  - **CHILD 1 MONTH–1 YEAR** 300 mg  
  - **CHILD 1–10 YEARS** 600 mg  
  - **CHILD 10–18 YEARS** 1.2 g  
  - **ADULT** 1.2 g  
  - **Note** A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer  
*or if history of allergy to penicillin*  
*Cefotaxime injection (1 g)*  
- By intravenous injection (or by intramuscular injection if venous access not available)  
  - **NEONATE** 50 mg/kg  
  - **CHILD 1 MONTH–12 YEARS** 50 mg/kg (max. 1 g)  
  - **CHILD 12–18 YEARS** 1 g  
  - **ADULT** 1 g  
  - **Note** A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer  
*or if history of immediate hypersensitivity reaction (including anaphylaxis, angioedema, or urticarial reaction) to penicillin or to cephalosporins*  
*Chloramphenicol injection (1 g)*  
- By intravenous injection  
  - **CHILD 1 MONTH–18 YEARS** 12.5–25 mg/kg  
  - **ADULT** 12.5–25 mg/kg  
  - **Note** A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer

**Diabetic hypoglycaemia**  
(section 6.1.4)  
**Glucose or sucrose**  
- By mouth  
  - **CHILD 1 MONTH–2 YEARS** 150 micrograms/kg as a single dose  
*or if hypoglycaemia unresponsive or if oral route cannot be used*  
*Glucagon injection (1 mg/mL)*  
- By subcutaneous, intramuscular, or intravenous injection  
  - **CHILD BODY-WEIGHT UNDER 25 KG** 500 micrograms (0.5 mL)  
  - **CHILD BODY-WEIGHT OVER 25 KG** 1 mg (1 mL)  
  - **ADULT** 1 mg (1 mL)  
*or if hypoglycaemia prolonged or unresponsive to glucagon after 10 minutes*  
*Glucose intravenous infusion (10%)*  
- By intravenous injection into large vein  
  - **CHILD 1 MONTH–18 YEARS** 5 mL/kg (glucose 500 mg/kg)  

**Myocardial infarction: ST-segment elevation**  
(section 2.10.1)  
*Aspirin dispersible tablets (75 mg, 300 mg)*  
- By mouth (dispersed in water or chewed)  
  - **ADULT** 300 mg  
*Glyceryl trinitrate aerosol spray (400 micrograms/metered dose)*  
- Sublingually  
  - **ADULT** 1–2 sprays, repeated as required  
*or Glyceryl trinitrate tablets (300 micrograms, 500 micrograms, 600 micrograms)*  
- Sublingually  
  - **ADULT** 0.3–1 mg, repeated as required  
*Metoclopramide injection (5 mg/mL)*  
- By intravenous injection  
  - **ADULT UNDER 60 KG** 18–19 YEARS 5 mg  
  - **ADULT OVER 60 KG** 18–19 YEARS 10 mg  
  - **ADULT OVER 19 YEARS** 10 mg
Diamorphine injection (5 mg powder for reconstitution)

- By slow intravenous injection (1–2 mg/minute)
  - **ADULT** 5 mg followed by a further 2.5–5 mg if necessary; **ELDERLY** or **FRAIL** patients, reduce dose by half

or Morphine sulphate injection (10 mg/mL)

- By slow intravenous injection (1–2 mg/minute)
  - **ADULT** 5–10 mg followed by a further 5–10 mg if necessary; **ELDERLY** or **FRAIL** patients, reduce dose by half

Oxygen, if appropriate

---

**Myocardial infarction: non-ST-segment elevation**

Treat as for **Angina: unstable**, above

Length

1 metre (m) = 1000 millimetres (mm)
1 centimetre (cm) = 10 mm
1 inch (in) = 25.4 mm
1 foot (ft) = 12 inches
12 inches = 304.8 mm

Mass

1 kilogram (kg) = 1000 grams (g)
1 gram (g) = 1000 milligrams (mg)
1 milligram (mg) = 1000 micrograms
1 microgram = 1000 nanograms
1 nanogram = 1000 picograms

Volume

1 litre = 1000 millilitres (mL)
1 millilitre (1 mL) = 1000 microlitres
1 pint ≈ 568 mL

Other units

1 kilocalorie (kcal) = 4186.8 joules (J)
1000 kilocalories (kcal) = 4.186 megajoules (MJ)
1 megajoule (MJ) = 238.8 kilocalories (kcal)
1 millimetre of mercury (mmHg) = 133.3 pascals (Pa)
1 kilopascal (kPa) = 7.5 mmHg (pressure)

Plasma-drug concentrations in the BNF are expressed in mass units per litre (e.g. mg/litre). The approximate equivalent in terms of amount of substance units (e.g. micromol/litre) is given in brackets.

Prescribing for children

Weight, height, and gender

The table below shows the mean values for weight, height, and gender by age; these values have been derived from the UK-WHO growth charts 2009 and UK1990 standard centile charts, by extrapolating the 50th centile, and may be used to calculate doses in the absence of measurements. However, an individual’s weight and height might vary considerably from the values in the table and it is important to ensure that the value chosen is appropriate. In most cases the actual measurement should be obtained as soon as possible and the dose re-calculated.

Recommended wording of cautionary and advisory labels

For details see Appendix 9

1. Warning: This medicine may make you sleepy
2. Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol
3. Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines
4. Warning: Do not drink alcohol while taking this medicine
5. Do not take indigestion remedies 2 hours before or after you take this medicine
6. Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
7. Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
8. Warning: Do not stop taking this medicine unless your doctor tells you to stop
9. Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop
10. Warning: Read the additional information given with this medicine
11. Protect your skin from sunlight—even on a bright but cloudy day. Do not use sunbeds
12. Do not take anything containing aspirin while taking this medicine
13. Dissolve or mix with water before taking
14. This medicine may colour your urine. This is harmless
15. Caution: flammable. Keep your body away from fire or flames after you have put on the medicine
16. Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening
17. Do not take more than... in 24 hours
18. Do not take more than... in 24 hours. Also, do not take more than... in any one week
19. Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol
20. Take with or just after food, or a meal
21. Take 30 to 60 minutes before food
22. Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food
23. Suck or chew this medicine
24. Swallow this medicine whole. Do not chew or break
25. Dissolve this medicine under your tongue
26. Take with a full glass of water
27. Spread thinly on the affected skin only
28. Do not take more than 2 at any one time. Do not take more than 8 in 24 hours
29. Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine
30. Contains aspirin. Do not take anything else containing aspirin while taking this medicine
Abbreviations and symbols
Internationally recognised units and symbols are used in the BNF where possible.

preparation subject to prescription requirements under The Misuse of Drugs Act. For regulations see p. 8

t. d. s. = ter die sumendum (to be taken three times daily)

t.i.d. = ter in die (three times daily)

Latin abbreviations
Directions should be in English without abbreviation. However, Latin abbreviations have been used when prescribing.

The following is a list of appropriate abbreviations. It should be noted that the English version is not always an exact translation.

a. c. = ante cibum (before food)

b. d. = bis die (twice daily)

o. d. = omni die (every day)

o. m. = omni mane (every morning)

o. n. = omni nocte (every night)

p. c. = post cibum (after food)

p. r. n. = pro re nata (when required)

q. d. s. = quater die sumendum (to be taken four times daily)

q. q. h. = quarta quaque hora (every four hours)

stat = immediately

t. d. s. = ter die sumendum (to be taken three times daily)

t.i.d. = ter in die (three times daily)

E numbers
The following is a list of common E numbers and the inactive ingredients to which they correspond.

E102 Tartrazine
E104 Quinoline Yellow
E110 Sunset Yellow FCF
E123 Amaranth
E124 Ponceau 4R
E127 Erythrosine BS
E132 Indigo Carmine
E142 Green S
E171 Titanium Dioxide
E172 Iron oxides, iron hydroxides
E200 Sorbic Acid
E211 Sodium Benzoate

E223 Sodium Metabisulphite
E320 Butylated Hydroxyanisole
E321 Butylated Hydroxytoluene
E322 Lecithins
E420 Sorbitol
E421 Mannitol
E422 Glycerol
E509 Beeswax (white and yellow)
